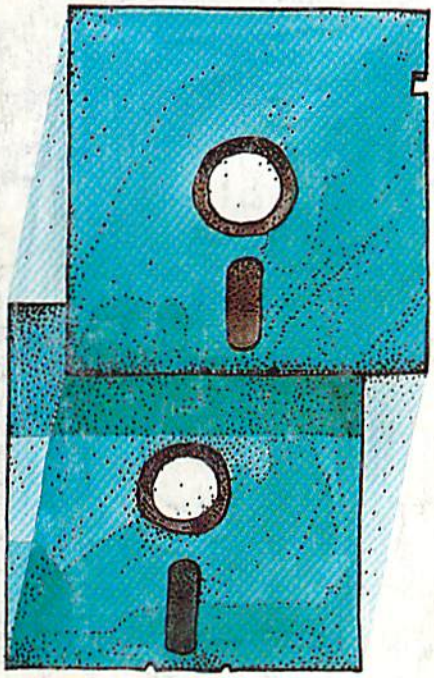
FOR **COMMODORE** PERSONAL COMPUTER USERS



Space Dock

Do you have the steady hand and quick eye it takes to land at this busy spaceport? A challenging game for the 64 and VIC.

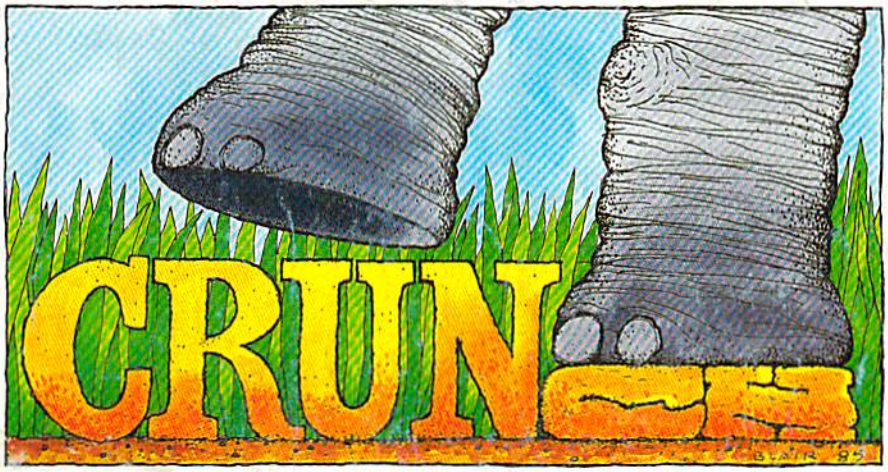
Programming Hi-Res Graphics On The 64

Three "how-to" articles to help you get the best in graphics.

Also In This Issue:
Programming Hints & Tips
Computing For Families
Software Reviews
And More

ReDisk

Here's an easy way to make backups of machine language and sequential files. For the 64, VIC, Plus/4, and 16.

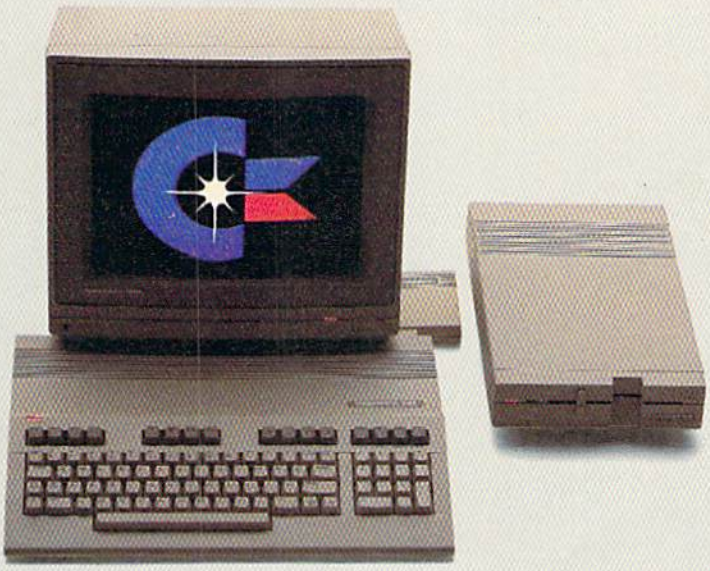


Crunch

Get more speed, efficiency, and memory with this powerful programming utility for the 64 and VIC.

0 71486 02220 08

If you own an Apple IIc,
you'd have to add three more Apple IIc's,
an Extra Keypad,
30 Block Graphic Sets,
Color Sprites,
two more voices,
four instruments,
a Cartridge Port, a Joystick Port,
and a Commodore 64...



to match the versatility, expandability and higher intelligence of the new Commodore 128

(and it costs less too).

The new Commodore 128™ personal computer is breakthrough technology at a breakthrough price. It outshines the Apple® IIc in performance capability, performance quality and price. It is expandable to 512K RAM. The IIc doesn't expand. Commodore 128 has a numeric keypad built into its keyboard that makes crunching numbers a lot easier. And graphic and sound capabilities that far exceed those of the Apple IIc. But the most important news is that Commodore 128 jumps you into a new world of business, productivity, education and word processing programs while still running over 3,000 programs designed for the Commodore 64.™ That's what we call a higher intelligence.

COMMODORE 128™ PERSONAL COMPUTER

A Higher Intelligence

THE BETTER LETTER BOX

Introducing EasyPlex.™ The new, easy-to-use electronic mail system from CompuServe.

Finally! Electronic Mail that's so easy to use you can start composing and sending messages the first time you get online.

Designed for various experience levels, EasyPlex has a menu mode with simple, easy-to-follow directions for beginners, and it lets experienced users save time by working in the prompt or command modes. With EasyPlex, you can compose, edit, send, file, and take advantage of sophisticated options previously available only with more expensive services.

CompuServe's EasyPlex lets friends and relatives, associations and club members communicate any time of the day or night. And small business owners, real estate professionals, insurance agents, lawyers, writers, etc. can communicate quickly and simply—either interoffice or interstate. "It's Easy." "Just Plex it!"

Best of all, EasyPlex is available to all CompuServe subscribers. And, along with EasyPlex, you get hundreds of valuable and entertaining computing options. Plus the assurance of belonging to the largest, fastest growing computer information service in the world and the premier supplier of business information to FORTUNE 500 companies.

Start communicating! To buy a CompuServe Subscription Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call or write:

THE EDITOR'S *notes*

Many of you will be a bit disappointed with the quantity of contents in this issue. In truth, this is the smallest issue, pagewise, in the history of COMPUTE!'s GAZETTE. What does it mean? Should we collectively grow concerned? No! Shrinkage continues in the personal computing marketplace. As if that weren't enough of a problem, August is traditionally the slowest month for publication advertising. These events have combined to lead us to this 96-page issue. As those of you who've been with us for very long are well aware, quantity isn't everything. Within these 96 pages you'll find the best value, the best quality of content available in the Commodore-only marketplace. Articles such as "Crunch" and "Zounds!," columns such as "Machine Language for Beginners," and a great deal more, contribute to the continuing level of quality we present in each monthly issue.

As we proceed into the fall issues, we'll regain pages in the magazine and sectors on the disk.

In spite of this, some of you will be disappointed with the size of the issue. We ask simply that you view each issue as cumulative month after month, providing you with an excellent value. And we thank you for your continued support and endorsement.

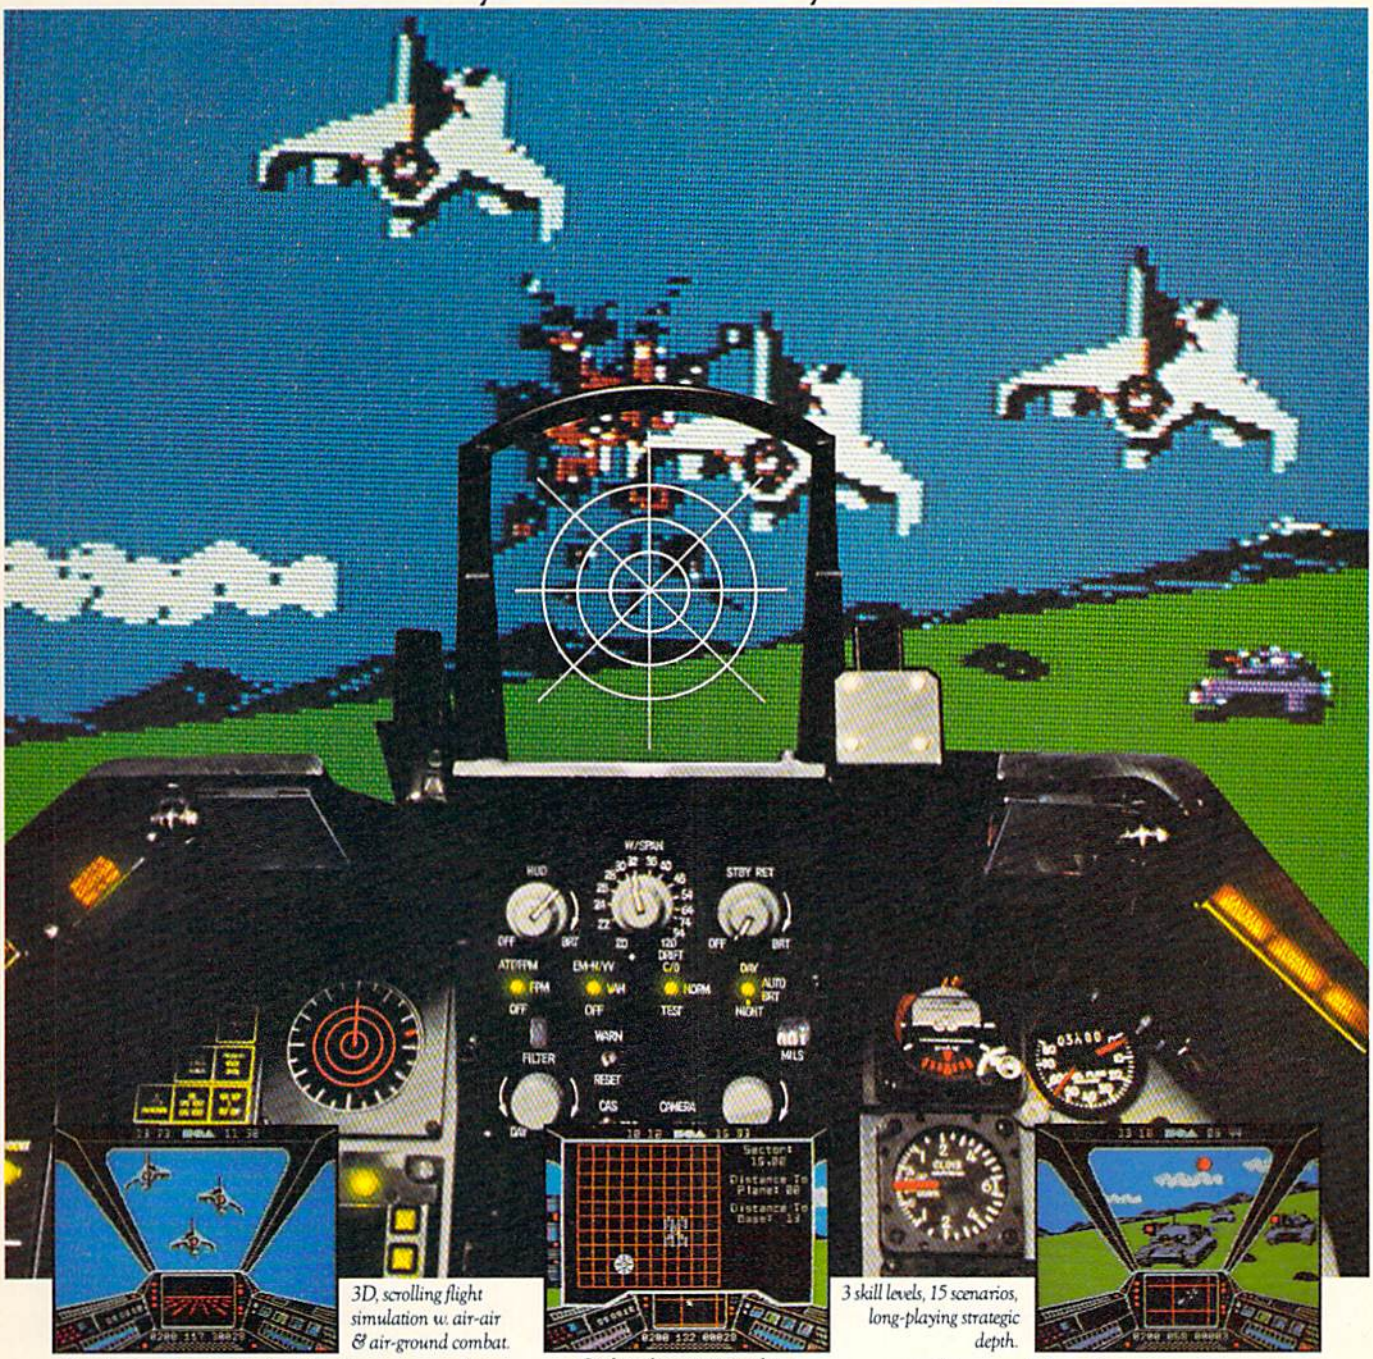
Mr. Mansfield has suggested that I write about the industry as a whole in this column—or perhaps he meant to suggest "hole," as in "black hole." Seriously, we remain, while subdued, confident. In these editorial pages, some many months ago we argued against the notion that personal computers would ever go the way of the CB radio craze of the seventies. From the present state of the marketplace, one must wonder whether or not we missed the boat on this particular call. We maintain that this is not the case. The personal computer market is alive, and if not particularly well, at least steadfastly alive.

We hear continued rumblings of a reawakening—if not from the direction of Commodore and the Amiga, then perhaps Atari. More probably both, plus Apple, IBM, and past or future players such as RCA or Sony or others. Will the resurgence come from a demand for home-based entertainment clusters? Combination VCR-compact disc programmable units? We think this may become a part of what the industry seems to be seeking. Surely though, intelligent appliances won't be the solution. We think they'll be one manifestation of our ability to integrate machine-level intelligence with human access. That is the key, in our opinion. Perhaps the solution will lie in a Topsy-like creation that combines the robot hotel of Fred D'Ignazio's fantasies with the technical austerity of one of Mr. Mansfield's machine language treatises. The offspring, while awesome to contemplate, will be truly functional and will have real-world utility. Will the next generation of personal computers please hurry forward? The industry, we fear, badly misses you.

Robert C. Lock

Editor in Chief

Fly the unfriendly skies.



3D, scrolling flight simulation w. air-air & air-ground combat.

On-board computer, working gauges & 3 weapon systems.

3 skill levels, 15 scenarios, long-playing strategic depth.

You're in the cockpit of a dream machine—a bad dream for the poor sap whose tail you're waxing. You stick a silver bird up his exhaust and wince as he blossoms into fire. And then you rain down like pestilence upon the grunts in the tanks.

Skyfox. It's the fastest-selling EA game in history. It has the most awesome, high-speed animation you've ever seen on your computer. It's played to rave reviews in every magazine. And it's yours—at your retailer—or direct from EA at (800) 227-6703 with a 14-day satisfaction or money-back guarantee.

COMPUTE! Books *Announces*

COMPUTE!'s VIC-20 Collection

with more than 70 never-before-published articles and programs for the Commodore VIC-20.

Included in this giant collection are over 30 games, plus utilities, applications, tutorials, and much more, most of which will run on an unexpanded VIC. *COMPUTE!'s VIC-20 Collection* contains something for every VIC-20 user. Even if you use just a fraction of the programs inside, this book will prove extremely valuable. Typing in the programs is made easy with "The Automatic Proofreader," an error-checking program that tells you right away if you've made an error.

Edited, $12.95, ISBN 0-87455-007-6

There's also a disk available which includes all the exciting, challenging programs from the book ready to run on your VIC-20. *COMPUTE!'s VIC-20 Collection Disk* saves you typing time and prevents many typing errors. It's fast, convenient, and inexpensive. You can order the *Disk* from COMPUTE! Books for only $12.95.

GAZETTE FEEDBACK

Editors And Readers

Do you have a question or a problem? Have you discovered something that could help other Commodore users? Do you have a comment about something you've read in COMPUTE!'s GAZETTE? We want to hear from you. Write to Gazette Feedback, COMPUTE!'s GAZETTE, P.O. Box 5406, Greensboro, NC 27403. We regret that due to the volume of mail received, we cannot respond individually to programming questions.

Automatic Proofreader

In most of your program listings, you put a colon and a one-to-three digit number after each line. What's the reason for this?

Paul Gremel

COMPUTE!'s GAZETTE *frequently (usually every other month) publishes a program called "Automatic Proofreader." When you type it in and run it, it prints a number at the top of the screen every time you press RETURN.*

If you load and run the Proofreader before typing a GAZETTE *program, you can check the number on the screen against the rem number after each line of the program listing. If they don't match, you've made a typing mistake. It's not completely foolproof, however. The checksum comes from adding up the ASCII values of the characters you type (every character has a corresponding ASCII value—"A," for example, is character number 65), and if you transpose two characters (PRITN instead of PRINT, for example), the number appears to be correct even though the line is entered incorrectly. And the Proofreader ignores spaces because Commodore BASIC allows you to enter either PRINTA (no space) or PRINT A (with a space). Spaces inside quotation marks can be important, though, so be careful when typing lines containing "strings." And if you accidentally forget a line, Proofreader can't tell you that a line is missing.*

When you're checking a program that doesn't work, watch for spaces, missing lines, and transpositions (especially if the program has a lot of DATA statements containing numbers). To find missing lines, look at the magazine listing first, then check the screen, rather than looking at the screen first. If you've forgotten to type a line, everything you see on the screen will be in the listing, but not everything in the listing will be on the screen.

Preventing Disk Drive Heat Buildup

Many of us worry about disk errors caused by overheating of the drive. Even after just half an hour, my 1541 becomes quite warm. An external fan works well, but it should be turned on when the disk drive is first turned on. If you wait until the heat has already built up, much of the heat will be blown toward the disk and the read/write head, thus causing the problem you're trying to avoid by using a fan.

Joseph T. Malloy

Thanks for the tip. Some 1541s (and a few 64s as well) suffer from heat buildup, especially in the middle of summer. Muffin fans, available at electronics stores, can help prevent overheating.

Running Part Of A Program

Is there a program or routine that will allow me to run only a certain amount of lines? I know I can type RUN 1140 and it will start at line 1140, but I can't get the computer to run only a segment.

Andy Harvey

*Either RUN 1140 or GOTO 1140 will start up a program at that line. The difference is that GOTO preserves variables, while RUN erases them. You can define variables before a GOTO—***X=5:N$="SAMPLE STRING":GOTO410***. This technique is useful when you're testing subroutines or sections of a program.*

To stop the program at a certain line, insert a STOP or END. Or press the RUN/STOP key. You can then examine variables by printing them. Type CONT to make the program continue.

Double Meanings

"Disk Merge" in January appears to have an error. Line 340 says QUIT=FC$="*" and from what I've read about converting programs to the 64, you have to rewrite lines like A=B=C.

Richard D. Evans

Some versions of BASIC allow multiple assignments, like A=B=15, which would have to be translated

AMAZING DAISY

NOW! FULL SIZE, FULL FEATURE, LETTER QUALITY AT ONLY $353

If you have been searching for a letter quality printer you have probably found the flood of claims and counterclaims to be a real roadblock in your search. Not long ago we were in the same position. We tried to determine which daisy wheel printer had all the features our customers wanted, yet would not set them back a month's salary. Recently several manufacturers have introduced machines that had features we were seaching for. After a thorough assessment, we eliminated one model after the other for lack of one feature or another until we only had one left.

THE RESULTS ARE IN

We found the printer which has all the features anyone could want. The winner is the Aprotek Daisy 1120, a real heavy-duty workhorse printing at 20 characters per second. The manufacturer is Olympic Co. Ltd., a highly respected Japanese firm.

FEATURES GALORE

This printer has it all. To start with, it has a front panel Pitch Selector button with indicators which allows 10, 12, 15 characters per inch (CPI) or Proportional Spacing. There is a Select (Online) button (with indicator) and a Line Feed button. You can also set Top-of-Form or Form Feed with the touch of the TOF button. Other front panel indicators include Power and Alarm.

To load a sheet of paper, simply place it in the feed slot and pull the paper bail lever. PRESTO! The paper feeds automatically to a 1 inch top margin and the carriage aligns to the selected left margin. In this manner, each page can have identical margins automatically. You can continue to compute while the Daisy 1120 is printing. The built in 2K buffer frees up your computer while printing a page or two allowing you to go to your next job.

To really put your printer to work, the Cut Sheet Feeder option is great for automatic printing of those long jobs. Also available is the adjustable Tractor Feed option. Compare our option prices! Best of all the Daisy 1120 is quiet: only 57 dB-A (compare with an average of 62-65 dB-A for others).

COMPLETE COMPATIBILITY

The Daisy 1120 uses industry standard Diablo® compatible printwheels. Scores of typeface styles are available at most computer or stationary stores. You can pop in a 10, 12, 15 pitch or proportional printwheel and use paper as wide as 14". At 15 CPI you can print 165 columns—great for spreadsheets.

The Daisy 1120 uses the Diablo Hytype II® standard ribbon cartridges. Again universally available.

Not only is the hardware completely compatible, the control codes recognized by the Daisy 1120 are Diablo 630® compatible (industry standard). You can take advantage of all the great features of word processing packages like Wordstar®, pfs: Write®, Microsoft Word® and most others which allow you to automatically use superscripts, subscripts, automatic underlining, boldface (shadow printing) and doublestrike.

The printer has a set of rear switches which allow the use of standard ASCII as well as foreign character printwheels. Page length can be set to 8, 11, 12, or 15". The Daisy 1120 can also be switched to add automatic line feed if required.

THE BEST PART

When shopping for a daisy wheel printer with all these features (if you could find one), you could expect to pay $600 or $700 dollars. The options would add much more. *Not now!* We have done our homework. We can now offer this printer for only $353. Order yours today!

NO RISK OFFER

Try the Daisy 1120 for 2 weeks. If you are not satisfied for ANY reason we will refund the full price—promptly. A full 1-year parts and labor warranty is included.

THE BOTTOM LINE

Aprotek Daisy 1120 (Order#1120) $353 w/standard Centronics parallel interface and 2K buffer.

Options

Auto Cut Sheet Feeder (#1110) $188
Tractor Feed (#1112) $77

Accessories

8' Cable for IBM PC® and compatibles (#1103) $26

Interface with cable: •TI-99/4A (#106) $66
•Apple II or IIe (#1104) $76
•All Commodore (except Pet) (#1105) $44
•All Atari (#1107) $66

Shipping is $11—UPS continental USA. If you are in a hurry, UPS Blue or Air Parcel Post (second day air) is $25. Canada, Alaska, Mexico and Hawaii are $30 (air). Other foreign is $60 (air). California residents add 6% tax. Prices are cash prices—VISA and M/C add 3% to total. We ship promptly on money orders, cashier's checks, and charge cards. Allow 14-day clearing for checks. No C.O.D.'s. Payment in US dollars only.

to A=15:B=15 on a Commodore computer. Putting a number into a variable (called assignment) is one of the functions of the equals sign.

But "=" has a second meaning. The equals sign in IF A=15 THEN PRINT "FIFTEEN" causes the computer to compare the current value of A against 15, and if A=15 is true then print something. There is already a value in A, and the equals sign is not assigning, but comparing. The computer marks a true statement with −1; a false statement with 0. In line 340 from Disk Merge, the first equals sign assigns, the second compares. The variable QUIT is given a value of 0 or −1 depending on the truth of FC$="".*

Try typing the following lines to see the difference between assignment and comparison:

```
A=5:B=A=5:C=A=6
PRINT A,B,C
PRINT A=5,A=6
```

One Key Disk Load

I own a Plus/4 and have found a way to load programs from the directory. First, type this:

```
KEY 1, "DLOAD"+"{19 RIGHT}"+"
{3 SPACES}"+CHR$(13)+"{CLR}"
```

Next, list the directory by pressing f3, move the cursor to the line where the program is, and press f1. The program loads and the screen clears.

Juan Sanchez

It certainly helps to have definable function keys. This shortcut should help our readers who own a Plus/4 or 16.

Throwing Out Garbage Strings

I have a program that works fine most of the time, but during some operations it stops in the middle of a routine and takes a few seconds to start again. I know the variables are stored at the end of the program and was wondering if they may be interfering with the program. Could I put the variables elsewhere?

N.L Jonker

A numeric variable takes up a certain amount of memory, no matter what number you assign to it. String variables, though, need different amounts of memory according to how many characters they hold. Type in the following program:

```
10 GETG$:IFG$=""THEN10
20 IFG$<>CHR$(13)THENPRINTG$;:A$=A$+G$:GO
   TO10
30 PRINT:FORJ=(PEEK(51)+256*PEEK(52))TO(P
   EEK(55)+256*PEEK(56)-1)
40 PRINTCHR$(PEEK(J));:NEXT
```

This is a short program, leaving a lot of room for variables. Run it and type ABC followed by RETURN. You should see ABCCABBAA. The first three letters (ABC) are the current value of A$, while the fourth (C) is the most recent value of G$. Everything else is garbage—old values of A$ and G$. (First G$ held an "A," so A$ held an "A." Next, G$ was "B," and A$ equaled "AB.") Dynamic string variables are stored at the end of available memory with new strings added underneath. Try running the program and typing "TUVWXYZ," to see how much garbage is generated.

At some point in your program, the computer is running out of memory for new strings, so it has to get rid of the unused characters in a process called "garbage collection." It searches through memory for invalid strings and erases them. This may take a minute or so, depending on how many string variables you've defined. You can't avoid garbage collection, although you can force it to happen by defining a variable as FRE(0)—the amount of free memory remaining. For more about this subject, see "Debugging BASIC, Part 2" in February.

Another reason you may see pauses is related to how variables are stored in memory. A BASIC program is stored at the beginning of available memory. It is followed by simple variables, then array variables. If you DIMension a very large array, then define a simple (nonarray) variable, it takes some time to move the whole array up a few bytes in memory (about half a second for a 5000-element array). The solution is to define all nonarray variables at the beginning of your program.

Smooth Paper For The Okimate

We've found an alternate source of paper smooth enough for the Okimate 10 printer. The only disadvantage is that it comes in single sheets rather than fanfold. It can be found at Sears, catalog number 3A5470, $5.99 for 500 sheets.

Thomas Parady

Smooth paper gives the best results on the Okimate and judging from the print quality of your letter, you've discovered a good alternative to ordinary bond paper. Thanks for the information.

Turning Off The Cursor Keys

Is there a way to disable the cursor keys? I'm writing a program and don't want anyone moving the cursor around in an INPUT statement.

Kyle Chow

There are several methods to prevent cursor movement during INPUT. The simplest is to **POKE198,1: POKE631,34** *before each INPUT. The first POKE tells the program one key has been pressed, the second puts a quotation mark in the keyboard buffer. This forces the computer into quote mode, and the cursor keys will appear as reversed graphic characters. You're not really disabling the cursor keys, just*

It's Absolutely Shocking!!!

After all these years, CMS Software Systems is still the only company providing professional quality accounting software for the complete line of Commodore business computers.

Whether you own an 8032, 8096, SuperPET, B-128, C-64, or the new C-128, we have a professionally written, fully integrated Accounting System designed especially for you.

Introduced in 1979, the **CMS Accounting System** was the first Accounting System available for Commodore computers. Not satisfied with just being first, we have continued to update, expand, and improve until today, the **CMS Accounting System** is widely recognized as one of the finest Accounting Systems available for any computer.

Now Available for the Commodore C-128

- General Ledger
- Accounts Receivable
- Billing
- Accounts Payable
- Job Costing
- Payroll

$179.95
Complete Price

For more information see your Commodore dealer or call Cathy York at 214/289-0677.

CMS Software Systems, Inc. • 2204 Camp David • Mesquite, TX 75149

preventing them from moving the cursor around the screen.

Or you can give up INPUT and use GET instead. After GETing a character, if it's not a cursor key, print it on the screen and add it to the string. If the user presses RETURN, a CHR$(13), then continue the program. You'd also have to check for the INST/DEL key. This is a little more complicated, but effectively disables the cursor keys.

Here's another method, a short machine language program that completely disables the cursor keys, both inside and outside of a program. Type it in, save it, and then run it.

```
10 FORA=710TO758:READB:POKEA,B:NEXT:END
20 DATA 169,229,141,143,2,169
30 DATA 2,141,144,2,173,246
40 DATA 2,73,1,141,246,2
50 DATA 208,10,169,72,141,143
60 DATA 2,169,235,141,144,2
70 DATA 96,165,203,201,7,240
80 DATA 4,201,2,208,4,169
90 DATA 64,133,203,76,72,235,0
```

SYS710 turns off cursor keys if they're on, and it turns them back on if they're disabled. The program inserts a machine language wedge into the keyboard table vector at $028F. For more details about this technique, see Mapping the Commodore 64 *from COMPUTE! Books.*

Flippy Update

We would like to clarify a comment regarding potential read/write head damage (June '85) caused by using both sides of a single-sided disk. Someone who uses the second side of a single-sided disk risks data loss because the flip side may not have passed error-free testing. Some vendors do certify "flippies" that have passed such testing. While there may be some concern about potential damage induced by debris trapped in the disk liner (and then released when the reverse side is used), it appears that this is not, in fact, a threat to the read/write head of the disk drive.

A Hardware Fix For Jumpy TV Screens

My 64 works fine with our RCA television, but when hooked up to a Zenith the screen skips up and down a quarter inch every second or two. The Zenith works fine with a VIC, but can't be used with a 64. Turning off the automatic fine tuning has no effect. Is there a hardware or software fix available?

Joe Tomanic

Jittery screens can often be fixed with a single POKE on a VIC (POKE 36864,133). But there's no simple fix for vibrating 64 screens.

Several readers have written about this problem. We called an authorized Zenith repair shop and a repairman asked if the television was an older model. Apparently, certain older TVs (not just Zeniths) have jumpy screens when hooked up to a computer. Zenith has sent technical bulletins about how to solve the problem to their repair shops. A jumper wire inside the TV must be cut, but it's not a job for an amateur. Contact a local TV service shop and have them take care of it.

Will It Fit On The Disk?

I have disks almost completely full and like to fill them up as much as possible.

Is there any way to figure out how many blocks a program is from its listing? Also, I've seen that many commercial games are exactly 66 blocks long. Any reason for this?

Afshin Livian

There's nothing really wrong with filling up disks, unless a disk is physically or magnetically destroyed and you have no backups of the programs or files. Also, the disk save-with-replace command has problems handling nearly full disks.

Each disk sector holds 256 bytes. The first two point to the next track and sector, leaving 254 for your own use. If you know how many bytes your program takes up, you can divide by 254 to find the number of disk blocks it will use.

FRE(0) returns the number of bytes not being used for the program and its variables. You can clear out the variables with the CLR command—type the letters C-L-R, rather than pressing SHIFT–CLR/HOME. The following line tells you how much memory is not being used by the program:

```
CLR:PRINT FRE(0)
```

If you own a 64 and the result is negative, add 65536. Once you know the amount of free memory, subtract it from the amount of BASIC memory. A Commodore 64, for example, when just turned on says 38911 BASIC BYTES FREE.

Let's say you have a Commodore 64 program in memory and CLR:PRINT FRE(0)+65536 results in 37192. Subtract from 38911 to get 1719. That's how many bytes your program uses. Divide that number by 254 and the result is between 6 and 7. Thus, your program will use seven blocks.

*Your second question is a puzzler: 16K is a nice even number in machine language, exactly a quarter of 64K, but calculating (16*1024)/254 returns 64 and a fraction. A 16K program should use 65 blocks, not 66.*

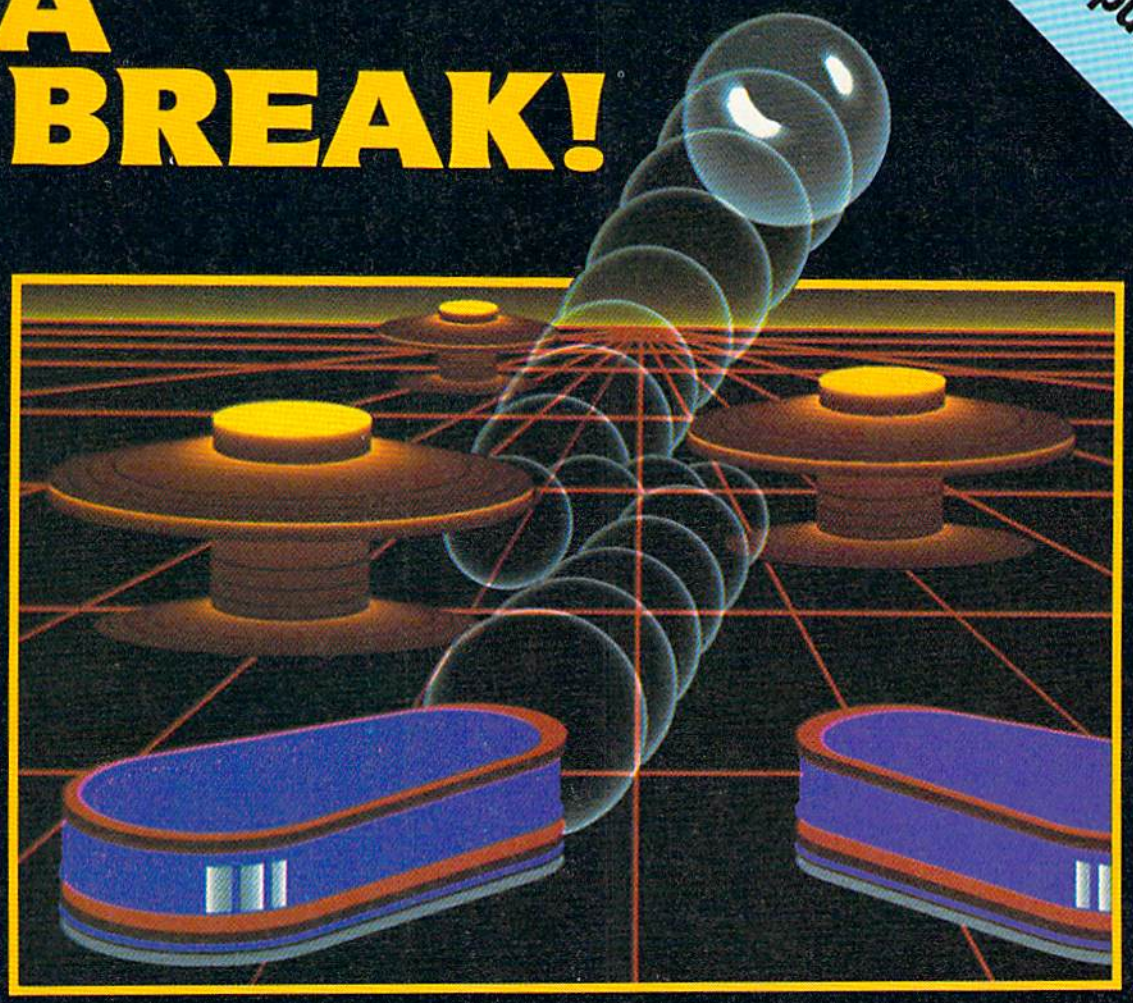
Moving Messages

I own a 64 and would like some information on how to get a message to scroll across the screen. I've seen this done in games I've bought.

Kurt Kunert

TAKE A BREAK!

For Commodore 64™ Computers



WITH NIGHT MISSION

PINBALL

You deserve the best. You've earned it. Now reward yourself with a session of Night Mission PINBALL, the most realistic and challenging arcade simulation ever conceived! ■ Stunning graphics and dazzling sound effects put Night Mission PINBALL in a class by itself. Game features: multi-ball and multi-player capabilities, ten different professionally designed levels of play, and an editor that lets you create *your own* custom modes. ■ So take a break with Night Mission PINBALL from SubLOGIC. Winner of *Electronic Games* magazine's 1983 Arcade Award for Best Computer Audio/Visual Effects.

Coarse scrolling, moving characters a character at a time, would be one answer. Position the cursor, print a CHR$(20) to delete the character to the left of the cursor, and you'll see the rest of the line scroll to the left. To move a line of characters to the right, print a CHR$(148), the insert control character.

Moving characters a pixel at a time, smooth scrolling, is a little more difficult. You can use custom characters or the smooth scrolling registers, but a somewhat easier method would be to use sprites.

Sprites don't have to be limited to players or objects in a game; you can just as easily define their shapes to look like words or phrases. You can create your own library of characters, or PEEK character ROM for the shape of each letter.

Like A Telephone Call

What in the world is an interrupt?

Brian Weese

Its name provides a hint—an interrupt is like an interruption. For example, if the telephone rings while you're reading a book, you would save your place with a bookmark and answer the phone. When the call (interrupt) is finished, you return to the book.

In a 64, a timing chip pulses a million times a second. The chip that runs the show, the 6510, listens to the clock and follows ML instructions, which may take two or more clock cycles to complete. This central processor talks to memory chips, fetching instructions for calculations and moving numbers around in memory.

There's another chip (the Complex Interface Adapter #1, or CIA for short) that spends most of its time doing nothing. When 1/60 second has gone by, it sends an interrupt request (IRQ) to the 6510. The main processing chip then marks its place in the program (with a sort of computer bookmark) and does some important work like checking to see if a key has been pressed and clicking the jiffy clock.

There's one more kind of interrupt, not a request, but a demand. A nonmaskable interrupt (NMI) is similar to a phone call that requires you to drop your book and leave the house for an emergency. Pressing RUN/STOP–RESTORE is an example. The computer doesn't go back to the program, it drops everything, stopping the program.

Using advanced techniques, you can insert your own short ML programs (wedges) in the interrupt routines. You can also trigger interrupts to happen when sprites collide or when a light pen sees a blip on the screen.

A Shortcut For Ending Disk Chatter

"An End to Disk Drive Chatter" from "Gazette Feedback" (December 1984) is one of the most important tips you have printed. If used consistently, it solves the problem of the disk drive banging when commercial software is loaded. But it's inconvenient to enter the line every time you load a program. Is there a simpler way to make it run?

Charles C. Badeau

The line that stops disk chatter is fairly short; all it does is write a 133 to memory location 106 inside the disk drive. But, yes, there is a shortcut:

```
10 OPEN1,8,2,"&C,U,W"
20 FORJ=1TO9
30 READK:PRINT#1,CHR$(K);
40 NEXT:PRINT#1:CLOSE1
50 DATA1,6,6,169,133,133,106,96,128
```

First, insert one of your own disks (do not try this with a commercial disk). Enter and save this program. Next, type RUN. A USR file with the name "&C" is created on the disk; think of it as short for "et cetera." Before loading a commercial program, insert your disk and type **OPEN 15,8,15,"&C"** *and then remove your disk and load the commercial software.*

If a file begins with an ampersand (&) and is written correctly, OPEN 15,8,15,"&filename" loads the machine language program from the file into the disk drive memory and automatically runs it. Ampersand files are an undocumented feature of the 1541 disk drive.

Why Machine Language?

A year ago I retired from an aircraft company where I worked on engineering programs for mainframe computers. I translated a program from FORTRAN to Commodore BASIC and it worked fine. But sometimes it took half an hour to finish the calculations.

I got interested in machine language, but realized that it would take a long time to learn enough to make the program run faster. Then I bought a BASIC compiler from Abacus. It compiled my BASIC to a machine language program that ran in four minutes.

If the compiler will make BASIC that fast, is there any reason to continue learning machine language?

George D. Johnson

There's no simple answer to your question. A compiled BASIC program is like a bicycle with a motor. You reach your destination much faster, but it's still not as fast as an automobile. If 30 minutes in BASIC is unacceptable, but four minutes after compiling is fine, you may not need to learn machine language. It depends on your goals.

With machine language, the time could probably be reduced to less than a minute, especially if you write a program from scratch, rather than translating from FORTRAN to BASIC to ML. But you might spend hours of programming and debugging time to gain the additional three minutes.

"KENNEDY APPROACH..."

NEW SPEAKING SIMULATION
See and Hear All the Action!

"...This is UA 236...Emergency Fuel...one zero minutes!!!..."

Commodore-64 Screen Picture

Voice Communications coming in from all directions!! 20 Aircraft in the pattern, and now you have an EMERGENCY!! As "Kennedy Approach", YOU are in charge!! It's your job to get all these aircraft and passengers on the ground or on the way safely!! You'll really be glad when this shift is over!!

"Kennedy Approach" is the first "Speaking Simulation" that allows you not only to control the exciting action in the skies around some of our busiest airports but also to hear and communicate with the simulation aircraft using computer generated speech. Fast action, great aircraft control simulation, and outstanding graphics and sound make "Kennedy Approach" a must addition to your simulation software library!!

SEE YOUR LOCAL RETAILER for "Kennedy Approach". Available for Commodore-64 and Atari computers for suggested retail of only $34.95. For more information on all MicroProse products call or write.

Experience the reality of these other great simulations from MicroProse:

Challenging and Exciting Air Combat from the Modern Electronic Cockpit!!

As close to the Real Thrill of Flying as You Can Handle!!

YOU are in Command — D-Day to the Battle of the Bulge!!

MicroProse Software

The Action is Simulated — the Excitement is REAL!!

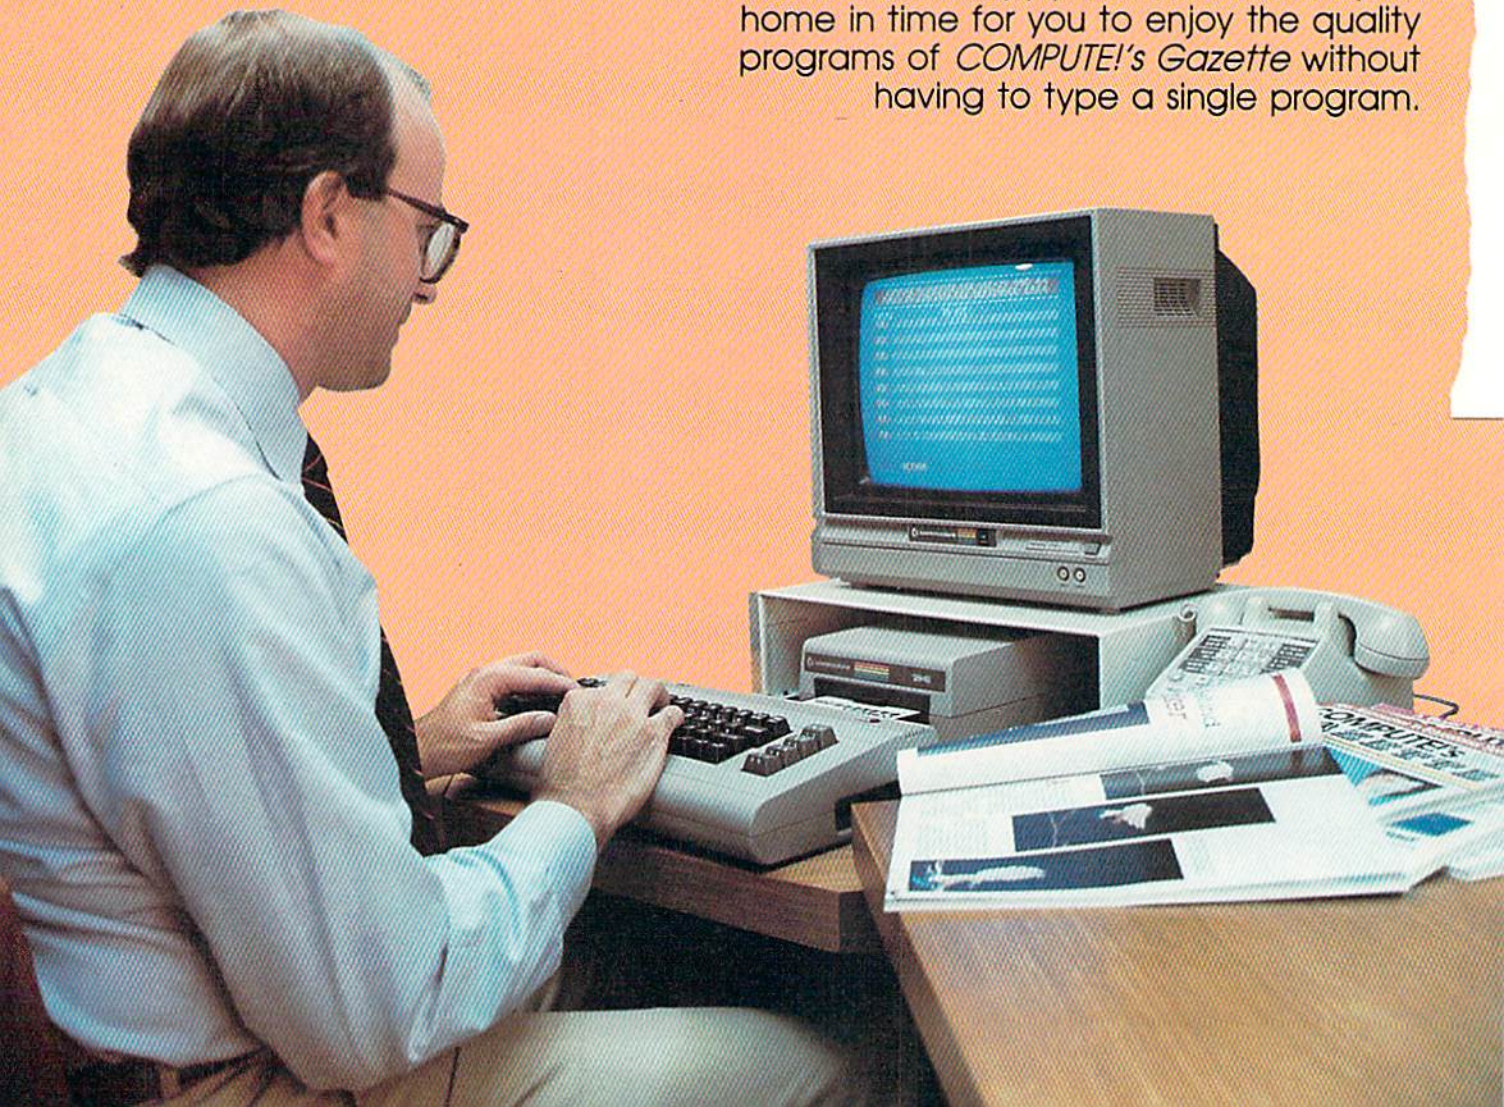
COMPUTE!'s *Gazette Disk*

Now you can enjoy the exciting programs from *COMPUTE!'s Gazette* on a ready-to-run disk

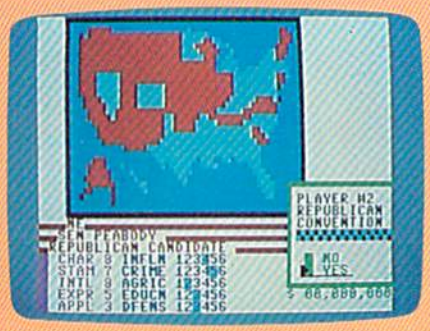
Every month you can receive *COMPUTE!'s Gazette Disk*, which includes the fascinating and challenging programs published in the corresponding issue of *COMPUTE!'s Gazette*, ready to load on your Commodore 64 or VIC-20.

The 5¼-inch floppy disk will arrive in your home in time for you to enjoy the quality programs of *COMPUTE!'s Gazette* without having to type a single program.



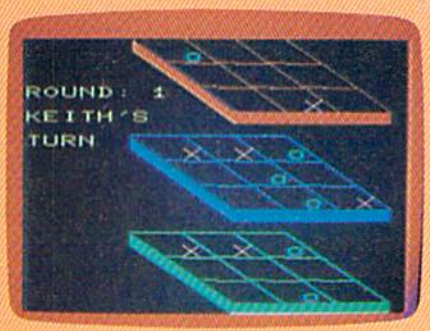
Timesaving

Using *COMPUTE!'s Gazette Disk* saves you time. Instead of spending hours typing in each program from *COMPUTE!'s Gazette*, you can load all the fun and fascinating programs in just a few minutes with the *Disk*. You have more time to enjoy Budgeteer, Mystery at Marple Manor, Vocab Builder, and many other exciting games and applications.



Inexpensive

And *COMPUTE!'s Gazette Disk* is inexpensive, only $69.95 for a one-year subscription. That means the *Disk* costs you $5.83 a month, a savings of 55 percent off the single disk price of $12.95. And what price can you put on the hours of typing time you save?

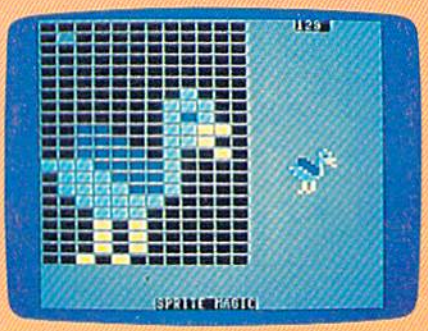


Risk-Free

All *Disks* are fully tested before they're shipped to you. And full documentation for all programs is in the corresponding issue of *COMPUTE!'s Gazette*. But if you should have a problem with a disk, just call toll free 800-334-0868 and a member of our Customer Service Staff will assist you.

Convenient

COMPUTE!'s Gazette Disk gives you access. As soon as you read about a new and challenging program in *COMPUTE!'s Gazette*, you can load the *Disk* and begin usng it immediately—the *Disk* is ready when you are.



Enjoy the quality programs from *COMPUTE!'s Gazette* on the convenient, ready-to-use *COMPUTE!'s Gazette Disk*.

To order *COMPUTE!'s Gazette Disk*
Call toll free 800-334-0868 (in NC call 919-275-9809) or mail your prepaid coupon to *COMPUTE!'s Gazette Disk*, P.O. Box 901, Farmingdale, NY 11737

Individual issues of the *Disk* are available for $12.95 (plus $1.00 shipping and handling.) Call 800-334-0868 to order.

YES! I want to save time and money. Please enter my subscription to *COMPUTE!'s Gazette Disk*.

☐ Save 55% off the single issue price. 1 year subscription, **$69.95**

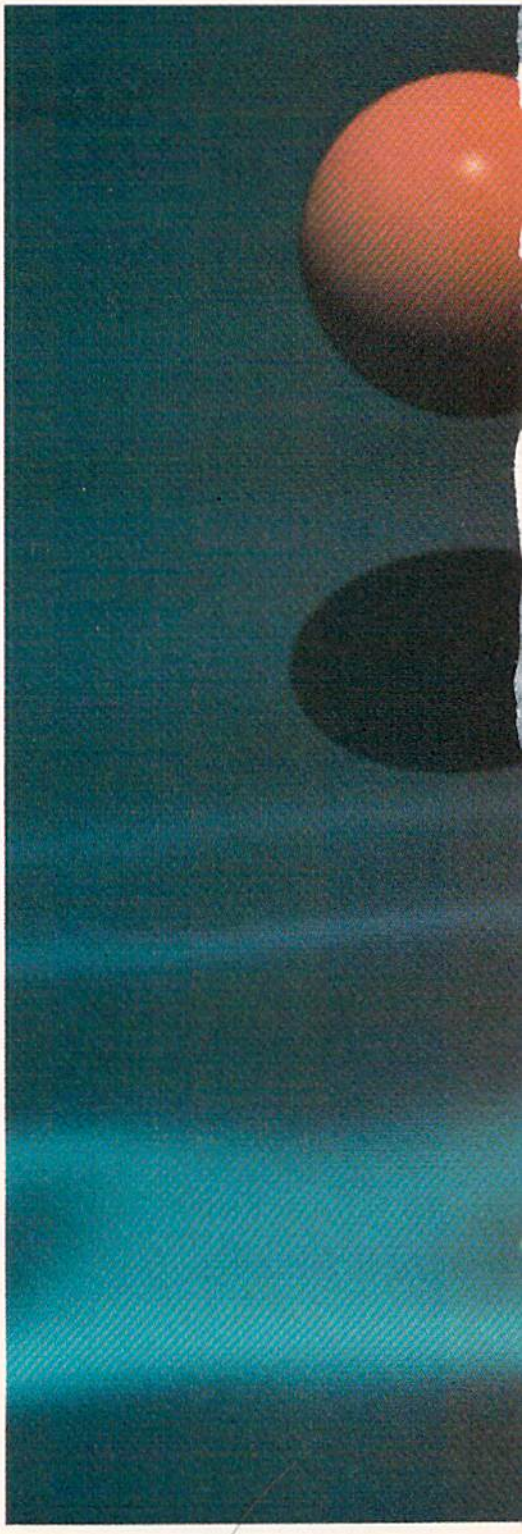
DIGITAL DESIGNS

The Evolution Of Computer Graphics

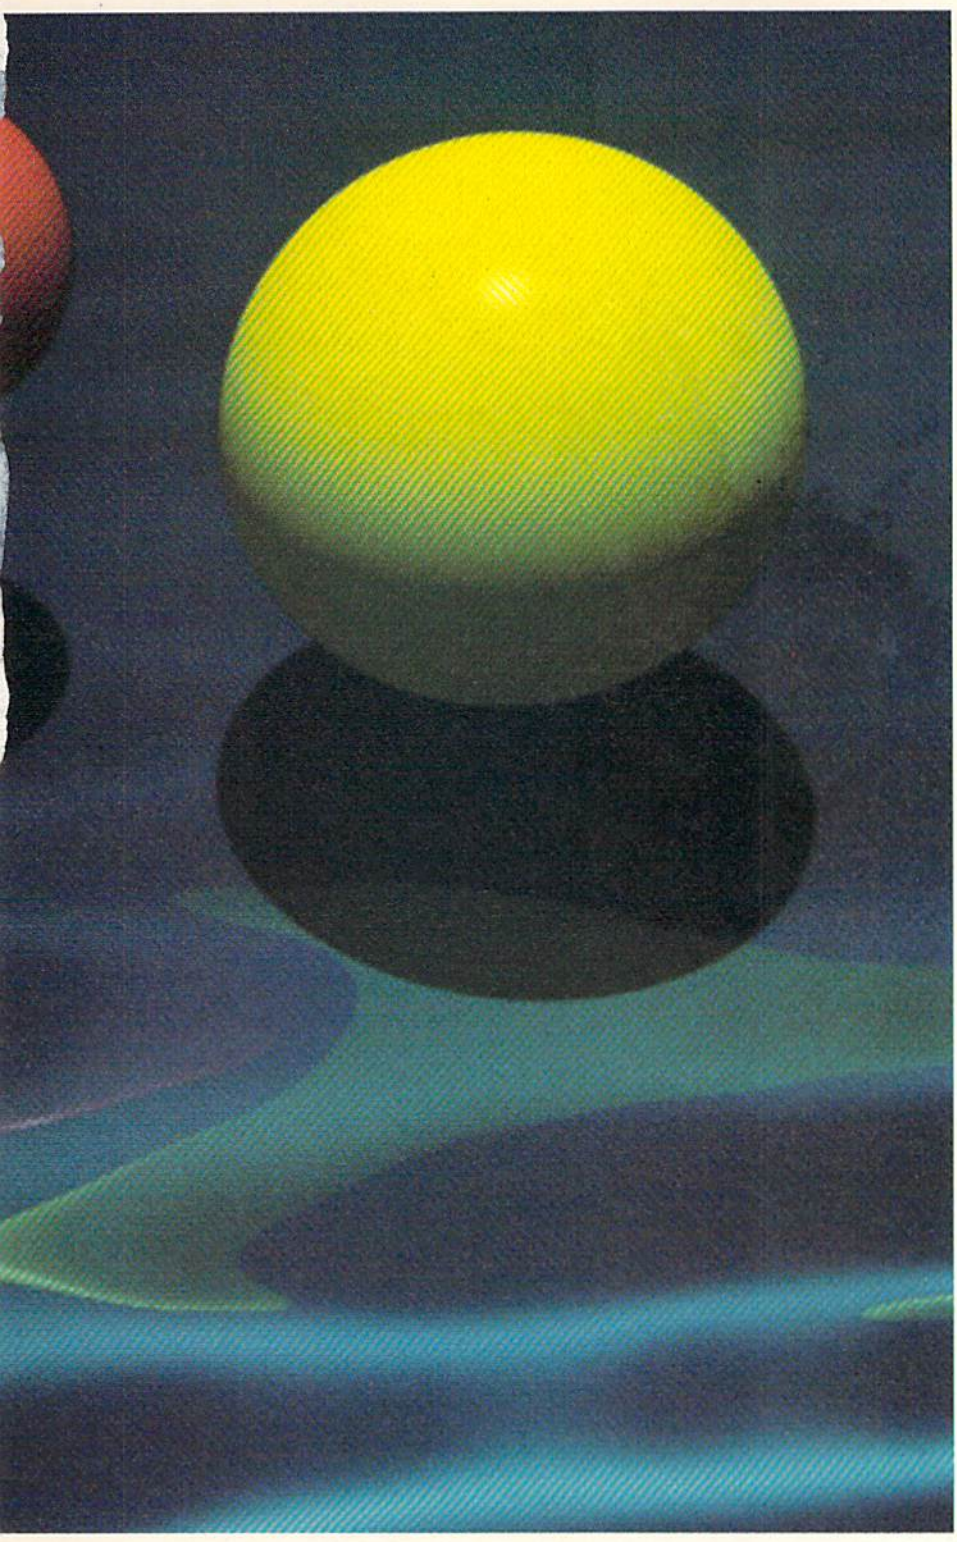


Kathy Yakal, Feature Writer

We've come a long way since Pong, the first computer videogame. Computer-generated graphics are making today's games look much more realistic. And they're revolutionizing imagery in art, science, television, and many other fields. In the next decade, with the help of new hardware—and the vision of those exploring new ways to expand existing technologies—we'll see this evolution continue.

Probably a day doesn't go by in your life when you don't see computer-generated images. Computer-enhanced pictures are used to predict the weather and find oil. They're used extensively in medicine to help cure disease and better understand the way the human body works. Filmmakers use them to create images that weren't possible before and, more recently, artists are using them to create comic books. Computer-generated graphics are allowing people in almost every field to better understand—and in some cases, to alter—the world around us.

Research on the uses of computer graphics in these areas has been going on since the days when computers filled entire rooms. But in the late sixties, young employees at electronics companies, as well as students at major American universities, were creating graphics for another purpose: games.



The earliest video entertainment available to the masses was Nolan Bushnell's *Pong*, a simple ping-pong style arcade action game. Players simply used an onscreen paddle to bounce a white "blip" back and forth. Bushnell built the game into a single-purpose console and asked permission to put it in a pizza parlor to test public reaction. As the story goes, the machine broke after a week. When it was taken apart for repair, the problem was obvious: the coin box was too full of quarters to accept any more.

Bushnell founded Atari to start mass-producing the game machines. As microprocessors became less expensive and easier to obtain, videogames moved into homes in the form of the videogame machine. As they were replaced by multipurpose home computers, thousands of software developers began to stretch the graphics capabilities of the tiny chips.

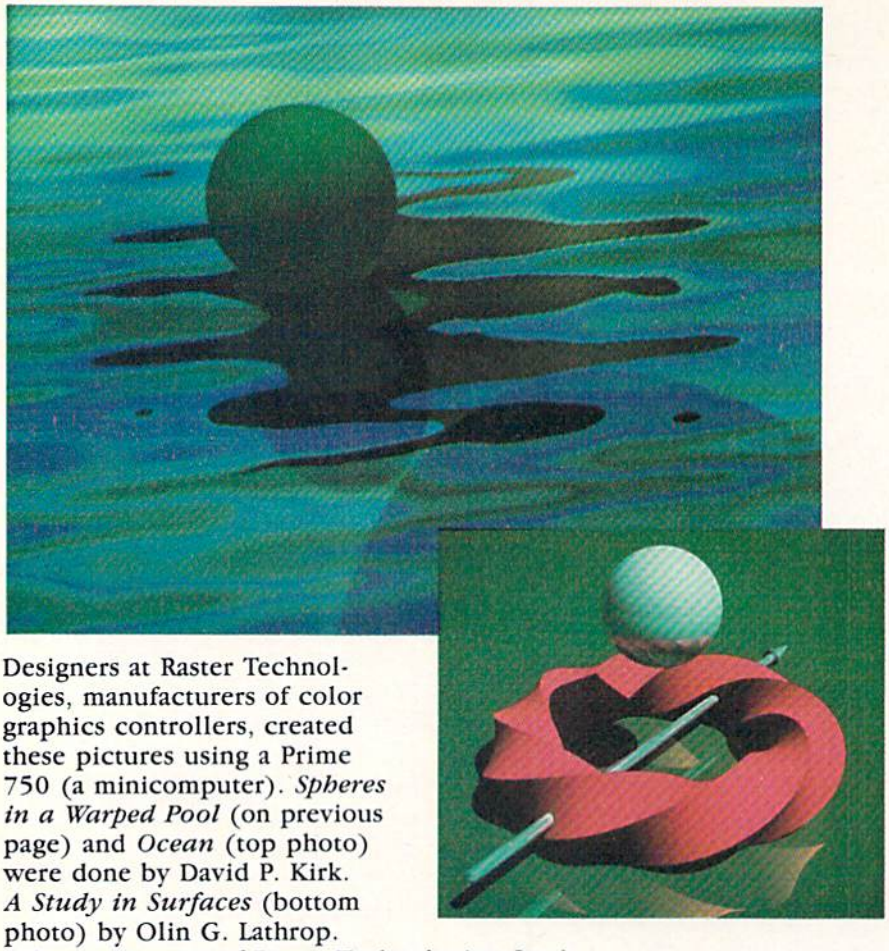
At about the same time that Nolan Bushnell was readying his new invention, nuclear physicist Melvin Prueitt was writing his dissertation on molecular dynamics. He needed a way to remove extraneous lines from some of his drawings, and his knowledge of computers allowed him to write programs that would do that.

But as he continued his work at Los Alamos National Laboratory, he found himself drawn more and more to experimenting with computer graphics to produce theoretical designs. And when some of those pictures started popping up on book covers, he decided to devote himself to that kind of work full time.

Prueitt had realized that scientific data—properly displayed—can be quite aesthetically pleasing. A young scientist was being lauded as an artist, a pioneer in the field of computer art.

Several of Prueitt's creations, along with those of other artists and scientists, were recently compiled in *Art and the Computer* (1984, McGraw-Hill), a collection of computer-generated designs which shows the range and vision of today's computer graphics pioneers.

Though a few of the book's pictures were produced on home computers, mini- and mainframe machines are required for sophisticated state-of-the-art graphics. "The main problem is not really the software in this case, but the hardware," says Prueitt. "The home



Designers at Raster Technologies, manufacturers of color graphics controllers, created these pictures using a Prime 750 (a minicomputer). *Spheres in a Warped Pool* (on previous page) and *Ocean* (top photo) were done by David P. Kirk. *A Study in Surfaces* (bottom photo) by Olin G. Lathrop. (Photos courtesy of Raster Technologies, Inc.)

computers don't usually have good enough resolution to produce the kinds of pictures you want. But as that improves, you'll see people doing some pretty fantastic things on their home computers.

"If you can close your eyes and imagine a beautiful scene, the question is, *How do you produce that scene so that someone else can see it?* If you're talented with a paintbrush, you get out your brush and spend several weeks trying to create that scene. If you're not that kind of artist, then you just keep it inside.

"But if you can conceive of pictures and also do the mathematics, then you can program a computer to produce that picture so other people can see it. I guess if you're just a pure mathematician and don't have any artistic feeling for anything, then you probably wouldn't be able to create a mental image. So you need to both be able to conceive of something, and then reduce it to a computer program that can produce the picture."

Which is not to say that you must necessarily be a talented programmer to create computer art. Graphics software—even digitizing systems—are available for home computers. Jack Nichols, art director for software publisher Mindscape, believes those tools make computers acceptable to artists who have an aversion to the machines.

"I don't think of them as computers. I think about them like I would a stick of charcoal or an oil paint brush or an acrylic medium. The more I'm around them, the more I find they're just a plastic box you can beat on."

Filmmakers have been expanding frontiers of computer graphics for years to create visual effects never before possible. It's not surprising, then, to see movie studios getting into the videogame business.

David Fox joined the newly formed games division of movie studio Lucasfilm in 1982. "We started experimenting with the Atari, the idea being to just create throwaway games," Fox recalls. "Partway through the project, we realized the games were too good to throw away."

Fox was sharing an office at the time with Loren Carpenter, who had extensive experience with computer graphics. Carpenter thought they might get some interesting results by using *fractals*—a mathematical principle not yet exploited by software authors—to develop the game's landscape. The result was *Rescue on Fractalus* (published by Epyx).

The theory of fractals isn't new. "It's just that no one had done it before," says Fox. But it's an example of the kind of research being done to move one step closer to even more realistic computer graphics. The next big step, though, is already here: the new generation of computers, the 16/32-bit machines based on Motorola's 68000 microprocessor (Apple's Macintosh, Commodore's Amiga, and Atari's ST).

"With the 16-bit machines, we can take what's been done before and make it run with a faster frame rate, more colors, and higher resolution," says Fox.

But that doesn't mean we have to reinvent the wheel, according to Jack Nichols of Mindscape. "We don't have to do another *Space Invaders*, or any of those other things that captivated audiences."

STARDOS

MAKES GREAT COFFEE!!

The 1541 is the slowest disk drive on planet earth. Even simple operations seem to take forever. Quickloaders and Fastloaders that software-patch the operating system are vulnerable to being knocked out of memory, rendering them totally useless. Even Flashier products that require permanent modifications to the 64 and 1541 can't compete with the blinding speed of STARDOS.

STARDOS accelerates every (yes, we said every) function of the 1541 disk drive. Other fast loaders only load PRG files faster. STARDOS also speeds up SEQ, REL, USR and DIRECT ACCESS files. Everything including FORMAT, VERIFY, SCRATCH, VALIDATE, INITIALIZE and COPY are much faster. In addition STARDOS adds a vast array of easy to use commands and utilities all at the touch of a key.

A sampling of STARDOS features:

- Accesses ALL types of files up to 1,000% faster!
- Saves up to 300% faster than normal (with extended verify)
- DOES NOT CHANGE THE SPEED AT WHICH THE DRIVE MOTOR SPINS
- Makes your 1541 MORE RELIABLE and LESS PRONE TO BREAK DOWN or OVERHEAT!
- STARDOS is fully expandable for multiple fast disk drives
- Easy (5 minute) plug in installation. User friendly manual
- 100% compatible with software and serial bus peripherals
- Adds years of life to your disks and drive in reduced wear
- Cures a number of bugs in the Commodore 64 and 1541 disk drive including :
  - The damaging 'Head Knock' that can mis-align your 1541
  - The @: Save with replace bug!!
  - The Editor lock-up bug
- Harness the full power of your disk drive with the built in DOS wedge
- Lock/unlock files and protect/unprotect disks from the keyboard
- Powerful sector editor allows direct viewing of diskette
- Upgrades computer and drive to the latest Commodore specifications
- Instant access to the build in mini-wordprocessor for short notes and memos
- Built in copier copies all file types (even relative) easily and effectively
- Built in disk duplicator copies an entire diskettte in less than 3 minutes
- Fully expanded machine language monitor, always on line
- Quality hardware. Full 120 day repair or replace warranty
- Satisfaction guaranteed or money back—no questions asked
- (Oh, by the way, we lied, STARDOS makes ***LOUSY COFFEE***)

Simply the best. **$74.95**

[Take advantage of our introduction special at **$64.95**]

All photos courtesy of The Weather Channel. Artists: Mike Scearce (upper two photos, lower left) and Paul S. Newman (lower center and right).

The Weather Channel uses computers for creating more than weather maps and satellite photos. About 95 percent of its images are electronically produced, says art director Eddie Terrill. Using state-of-the-art graphics systems like the Quantel *Paintbox* has resulted in numerous broadcast awards for superior design. Beyond that, automating many of the station's functions allows meteorologists to concentrate more on something else: predicting the weather.

Rather, the new computers will move us closer to being able to do at home what Melvin Prueitt does on his computers at Los Alamos—and beyond. "Already, in fact, I see paint systems and things emulating systems that I've spent $150,000 for," says Nichols.

"I'm very selfish on this order. I want all the resolution I can get, all the colors I can get. I see these new machines giving me definable palettes, and not restricting me to the number of colors they give me."

And that kind of flexibility makes the computer medium more acceptable to him as an artist. "That freedom lets me just get in and zip around. I don't care if they want me to do it with a mouse or a joystick or a tablet or by talking into a microphone. I don't care how they get me there because I'll draw with my foot if that's what it's going to take me to do it."

By providing such artistic satisfaction and maneuverability to the designers of software, the consumer ultimately benefits. "What we're aiming for is an experience that people can have when they play a game that makes them feel like they're really in the environment. I know *I* want something in my house that can do that," says Lucasfilm's Fox.

So how long will it be before we see images on computer screens that make us think we're watching television? That can be done now, says Fox, but not in realtime. To create a picture like that on a fairly large computer can take hours. And it could be another ten years, and a few more generations of microprocessors, before people can do that in their homes.

One thing it takes to make pictures look real is a process called *anti-aliasing*, a blending of the boundaries wherever two colors meet on a design. If a computer cannot generate enough shades of each color to do that, edges look stair-stepped instead of smooth. Fox looks for computers to contain specific chips for just that function.

Another boon would be the use of *CD ROM's* in future computers. A CD ROM is a read-only memory device that uses a compact disc format for digital information. Currently, CD machines are available as music systems. If a home computer were interfaced with a compact

Add $5 for COD orders. $15 Minimum for VISA/MC. Hardware requires additional freight charges. Ohio residents add 5.5% sales tax. All items subject to availability and price change.

MasterCard

disc player, it would add over 500 megabytes of storage space. (Most CD players have jacks labeled "For future expansion"; this is one possible use.)

Besides the obvious advantage of that much extra storage space (you could literally store encyclopedias on disks), the entertainment possibilities are tremendous. "You could store precomputed images—the ones that take hours to produce—and then bring them up in a game so you get really nice images," says Fox. "It's a way to force the small computers to do more."

Another popular form of home entertainment may also become a part of your computer system: the video cassette recorder (VCR). "When these machines talk to my VCR at home—and I'm sure they will—I see me being able to freeze a frame and grab it from my VCR, and my computer will understand that," says Nichols. "I see that as setting up horizons that I can ram around in."

All of these new, powerful tools may bring forth hidden talents from unexpected sources, says Prueitt. "I think that what you're going to see is that people who are, by nature, let's call it spiritually artistic, the kind of person who appreciates beauty, who likes to see beautiful landscapes or spend hours in museums looking at pictures...maybe those people don't have the coordination to be able to produce that on a piece of canvas, but it's inside of them...this is the kind of person who I think will be brought forth by computers. Whether they're traditional kinds of artists or not, they're artistic inside and they'll be able to produce art."

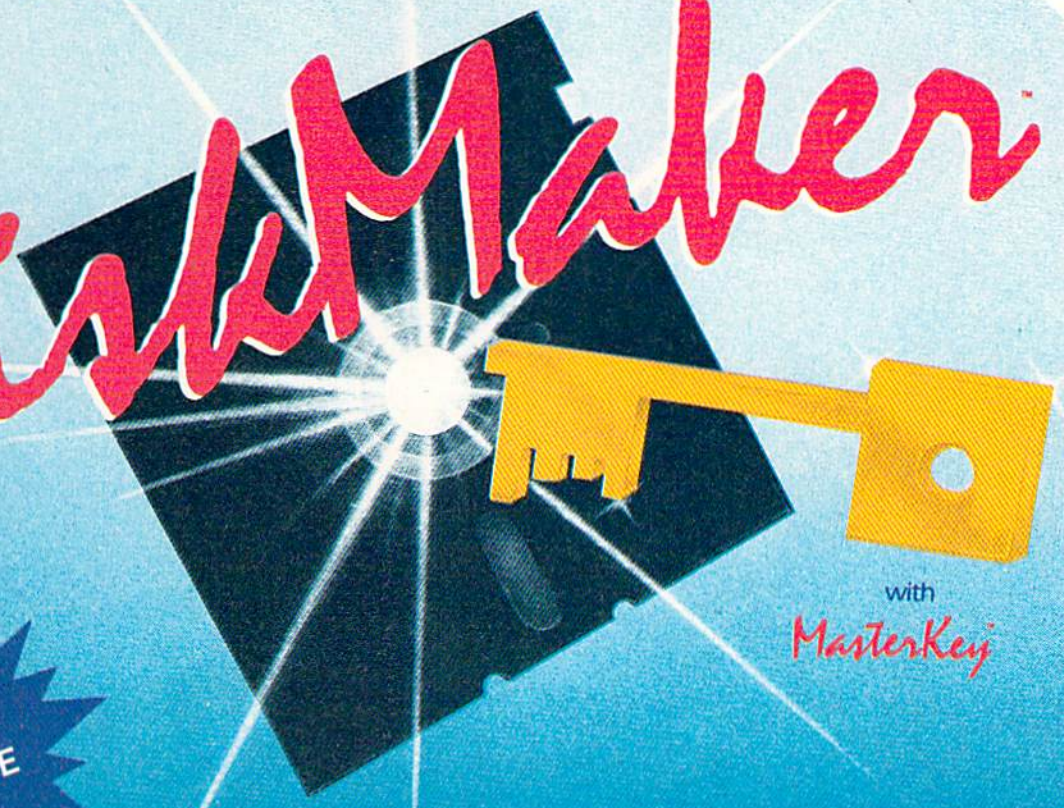
MAKE A BACKUP COPY WITH

NEW! Version 2.2

DiskMaker



with MasterKey

99% EFFECTIVE

THE AUTOMATIC DISK BACKUP SYSTEM FOR YOUR 64 & 1541 DRIVE!

- Uses NEW Vari-sector track scanning process
- Actually copies a FULL disk in only 3 MINUTES!
- Easiest to use—TOTALLY automatic copy utility
- NEW Auto-Sensor detects and copies half-tracks
- Breaks through LATEST protection schemes
- 3 copiers in 1! Includes FAST Copier, VARI-SECTOR Copier, and HALF-TRACK Nibbler
- Copies normal & HALF-TRACKS up to track 40
- NEW sync-seeking logic reduces copy time
- 100% machine code for fast, RELIABLE operation
- NO analysis required, just swap disks...& NO damaging drive knock during errors, format, or copying
- Detects & DUPLICATES extra sectors, hidden ID's, altered headers, frequency & track density
- All copiers AUTOMATICALLY put "errors" on backup
- UNLOCKS protected disks for backup copying
- FASTEST & most advanced backup copier you can buy
- Writes errors 20, 21, 22, 23, 27, 29 WHILE COPYING!
- Transforms your 1541 into a SUPER-FAST copy drive!
- PRODUCT SUPPORT tel. #, revisions, and upgrades

UP TO 4 TIMES FASTER THAN OTHER COPIERS!

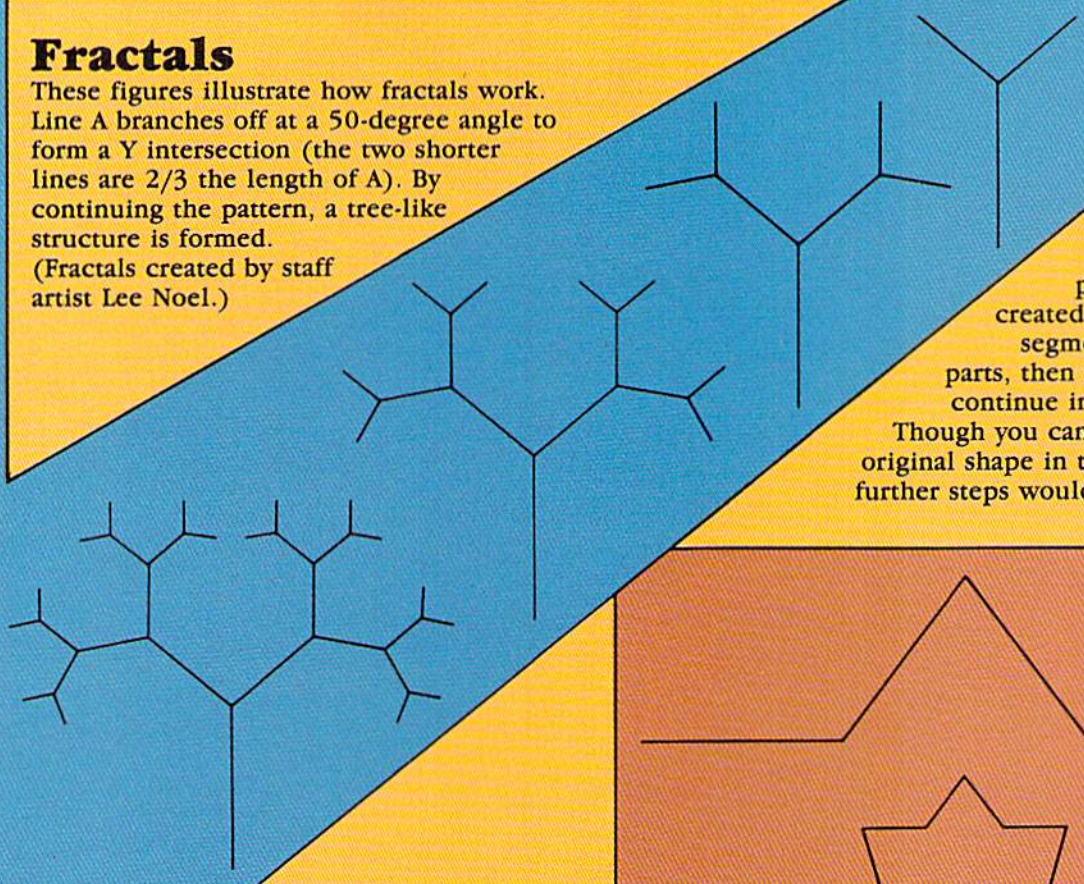
Funnies of the future? First Comics, of Evanston, Illinois, has produced the first comic book created on a microcomputer. Artist Michael Saenz drew *Shatter* on an Apple Macintosh, then added color to each frame.

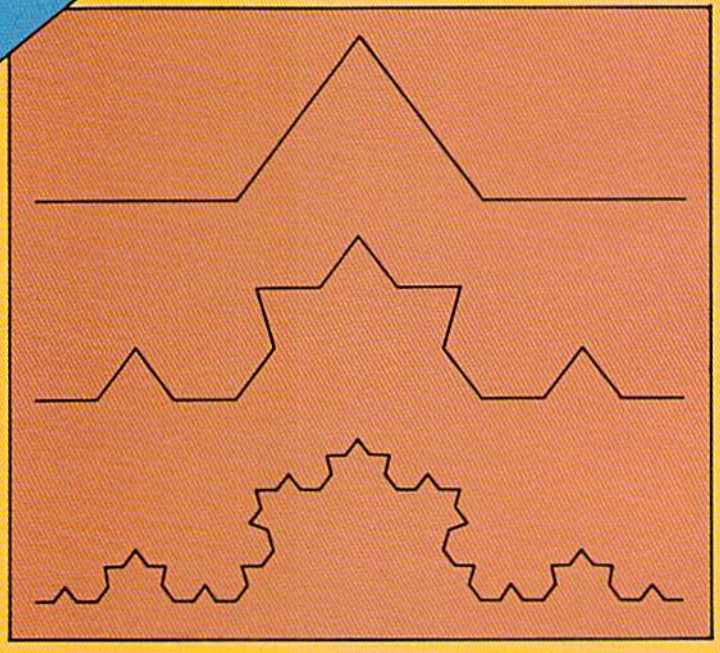
The Macintosh represents a major step in the evolution of computer graphics, says First Comics' Michael Gold, because of its affordability, ease of use, and high-resolution graphics capabilities. "The Macintosh is a very easy machine to use," he says. "For artists, who want to minimize interference, that's very important."

Fractals

These figures illustrate how fractals work. Line A branches off at a 50-degree angle to form a Y intersection (the two shorter lines are 2/3 the length of A). By continuing the pattern, a tree-like structure is formed. (Fractals created by staff artist Lee Noel.)



The lacy coastline pictured below was created by breaking a line segment into four equal parts, then letting that pattern continue in each of the parts. Though you can still make out the original shape in the fourth drawing, further steps would make it harder to distinguish.



Fractals were used in the development of *Rescue on Fractalus* to generate the constantly changing landscape. Had the design team at Lucasfilm Games used more traditional programming methods, the program would have taken up more memory, and each individual change in scenery would have had to be painstakingly plotted—which means the resulting graphics may have been much cruder.

HINTS&TIPS

BASIC Shortcuts

If you've discovered a clever timesaving technique or a brief but effective programming shortcut, send it to "Hints & Tips," c/o COMPUTE!'s GAZETTE. If we use it, we'll pay you $35. Due to the volume of items submitted, we regret that we cannot always reply individually to submissions.

Some Ideas For Beginners

Christophe Robin

To make a program run faster: • use NEXT rather than NEXTX or NEXTR; • don't put REMs inside FOR-NEXT loops; • use variable names of one letter, the more characters in a variable name, the slower the program runs; • write several statements on the same line, separated by colons; • when doing a lot of calculations, use variables rather than numbers (X=Y*Z instead of X=5*130).

If you're writing a program that contains POKEs or SYSes, save it to tape or disk before running it. If used improperly, these commands can lock up the computer and you'll lose the program.

When a disk drive makes crackling sounds and the red light is blinking, you may have a disk that's stuck in its envelope. Remove the disk, put a couple of fingers in the middle, and gently rotate it a turn or two. You may loosen the disk enough to make it work.

A long name for a disk program, like "DISKREADWRITE" gives you more information about what the program does, but may be difficult to remember. A shortcut is to use an asterisk (*) as a wildcard. LOAD "DI*",8 will load the first program that starts with the letters "DI." If there are other programs beginning with "DI" use something like LOAD "DISK*",8 or LOAD "DISKREAD*",8.

To reset your computer as if it had been turned off and then turned on, type SYS64738 on a 64, or SYS64802 on a VIC.

It's a good idea to validate heavily used disks once in a while, especially after you've scratched several files. Enter OPEN 15,8,15,"V0" and (on a separate line) CLOSE 15. This causes the drive to look through the directory and mark which blocks are being used for programs and files.

Taping Before Typing

Milton A. Young

Here's a tip for people who type in programs from magazines. To minimize errors, dictate the program first into a cassette player. Read slowly enough so that you can keep pace while typing. Include the line number, program line, and checksum number for "Automatic Proofreader." Then listen to the tape while you enter the program. It helps to have a pause button on the tape player. To keep from getting bored, I usually do 20 to 30 lines at one sitting and then take a break.

Overall, this method may take a little more time, but it has several advantages. First, you nearly eliminate typing errors, which means much less time spent looking for mistakes. And when you do mistype something, you can listen to the tape while you check the lines on the screen. It's even a good way to learn programming. For some reason, listening to yourself reading program lines gives you a better understanding of how the program works.

Defined Equations

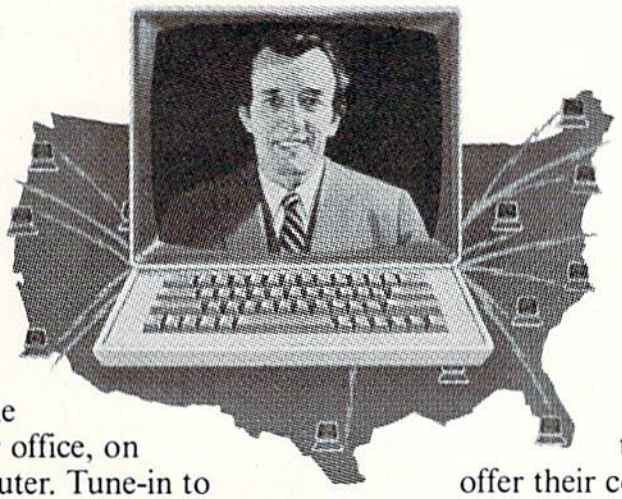
Paul Shaughnessy

The DEF FN command allows you to define a complex calculation as a function with a short name. DEF is short for DEFine and FN means function, so it's actually a function that creates a brand new function, like establishing a new keyword in BASIC:

```
10 DEF FN A(X)=(5*X)-10
```

If you place this function definition at the beginning of a program, you can later multiply by five and subtract ten, with function "A"—**PRINT FN A(20)** or **K=FN A(J)**, for example. In this simple function, one number comes in and another goes out, although it's possible to define functions that operate on more than one value.

The world's first Electronic University.™



Now, for the first time, you can take real courses, from live instructors all over the country, in your home or office, on your own personal computer. Tune-in to lectures and interactive seminars presented by renowned experts; arrange for private tutors or special courses for your children that accelerate learning; and access an Electronic Library of unlimited information, which includes 52 popular Data Base Services. You can even earn college and graduate-level credit through the system, with the added convenience of working at your own pace, within your own schedule. As little as $79.95 provides your entire family with lifetime enrollment in the Electronic University, and brings an expanded and continuing list of courses into your home. Enrollment Packages are available for IBM®, Apple®, and the Commodore® 64.

THE ELECTRONIC UNIVERSITY
TeleLearning Systems, Inc.
505 Beach Street, San Francisco, CA 94133
415/928-2800

If you are interested in earning college credit or a degree, universities and colleges throughout the country offer their courses on the Electronic University network, and feature experienced educators who will communicate with you on a one-to-one basis . . . If your interest is business, an array of field-specific courses are offered through Professional Associations and colleges, in addition to computer courses, career development programs, and training courses for employees . . . And the entire family will benefit from our Personal Achievement classes, an enlarged course listing for children, and our 24-hour Electronic Library. In other words, the Electronic University provides a vast and useful selection of courses and programs for all family members. See our catalog for a complete listing, or call for more information:

Now, to add a little twist to DEF FN, we can add another equals sign and a number:

```
10 DEF FN A(X)=(5*X)-10=20
```

All of a sudden, we have a defined equation. The first equals sign is part of the DEF FN command, the second equals sign says we're going to compare the left half against the right half of the equation. The function will return a zero if the equation is false, minus one if it's true, as you can see in this example. (The answer to this simple equation is 6.)

```
10 DEF FN A(X)=(5*X)-10=20
20 FOR J=1 TO 10:PRINT J,FN A(J):NEXT
```

There are several variations you can use to make defined equations more flexible. First, you don't have to limit the equation to one variable; you can insert additional variables, or PEEKs or other defined functions. And the second equals sign could be a less-than, greater-than, or both. With several such functions, you could loop through possible answers until you find one number that's too high, another that's too low. Then loop through that range, using a smaller STEP size, until you find the answer or an approximation. You can also use this technique to solve diophantine equations (as in math problems like "I have four coins that add up to 37 cents; what are the coins?").

COMPUSERVE HELPS YOU GET THE MOST FROM ANY COMPUTER.

Now CompuServe brings you:

- Popular CB simulator
- Easy new EasyPlex™ ELECTRONIC MAIL
- Regularly updated investment statistics
- New executive newswire clipping service
- Round-the-clock shopping
- Interactive games and trivia
- Electronic airline ticket reservations
- Over 800 other practical and fascinating options

To access CompuServe, you need a CompuServe Information Services Subscription Kit, a computer, a modem and, possibly, easy-to-use communications software.

YES! Send me my CompuServe Subscription Kit!

With it I'll receive a $25.00 usage credit; a complete User's Guide; my own exclusive user ID number and preliminary password; and an introductory subscription to your monthly newsmagazine ONLINE TODAY.

STARPOINT SOFTWARE proudly presents

ISEPIC

[say Icepick], a revolutionary new concept in software de-protection for the Commodore 64. ISEPIC is not a disk duplication system, but an extraordinary hardware/software combination that actually bypasses any disk protection scheme. ISEPIC captures and saves the protected program as it runs in the 64's memory, this "snapshot" becomes accessible to the user for complete inspection and alteration. From this image, ISEPIC can automatically create a compact, auto-booting, fast-loading file which is completely unprotected and self contained.

- ☆ Copies ALL memory-resident software
- ☆ ISEPIC'd programs load many times faster than originals
- ☆ ISEPIC is invisible to software—cannot be defeated
- ☆ Eliminates drive "knock" due to antique protection schemes—adds years of life to your drive
- ☆ Automatically "cracks" protected programs into single, auto-booting, superfast loading files
- ☆ Place multiple programs on a single diskette
- ☆ Create auto-booting, fast-loading versions of your own programs
- ☆ Cracked programs are completely self-contained and run independently of the ISEPIC adapter
- ☆ Copies software with a flick of a switch
- ☆ ISEPIC comes complete and ready-to-run, just plug into expansion port
- ☆ Programs cracked by ISEPIC may be used on MSD or 4040 drives as well as hard disks regardless of original protection schemes

When ordering by mail:

SYMBOL MASTER™

MULTI-PASS SYMBOLIC DISASSEMBLER FOR THE COMMODORE 64*

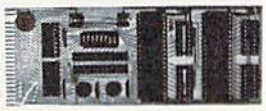
disassembles any 6502/6510 machine code program into beautiful source

- Learn to program like the experts!
- Adapt existing programs to your needs!
- Automatic LABEL generation.
- Outputs source code files to disk fully compatible with your MAE,* PAL,* CBM* or Develop-64* assembler, ready for re-assembly and editing!
- Outputs formatted listing to screen and printer.
- Automatically uses NAMES of Kernal jump table routines and all operating system variables.
- Generates list of equates for external addresses.
- Generates complete cross-referenced symbol table.
- Recognizes instructions hidden under BIT instructions.
- 100% machine code for speed.

(Symbol Master™ is not copy protected.)

ORDER NOW! Available on disk only. Introductory price $49.95 postpaid USA.

*MAE is a trademark of Eastern House.
PAL is a trademark of Pro-Line.
Commodore 64 is a trademark and CBM is a registered trademark of Commodore.
Develop-64 is a trademark of French Silk.



UNLEASH THE POWER OF YOUR COMMODORE 64 WITH THE ULTIMATE INTERFACE

- Control & monitor your home — appliances, lights & security system
- Intelligently control almost any device
- Connect to Analog-to-Digital Converters
- Control Robots
- Perform automated testing
- Acquire data for laboratory & other instrumentation applications
- Many other uses.

Don't make the mistake of buying a limited capability interface. Investigate our universally applicable Dual 6522 Versatile Interface Adapter (VIA) Board, which plugs into the expansion connector and provides:

Four 8-bit fully bidirectional I/O ports & eight handshake lines • Four 16-bit timer/counters • Full IRQ interrupt capability • Four convenient 16-pin DIP socket interface connections • Expandability up to four boards & sixteen ports.

ORDER NOW! Price $169, postpaid USA. Extensive documentation included. Each additional board $149.

COMMODORE 64™ SOURCE CODE!

"What's Really Inside the Commodore 64"

• Most complete available reconstructed assembly language source code for the C-64's Basic and Kernal ROMs, all 16K. • You will fully understand calls to undocumented ROM routines, and be able to effectively use them in your own programs. • Uses LABELS. Not a mere one-line disassembly. All branch targets and subroutine entry points are shown. • TABLES are fully sorted out and derived. • Completely commented, no gaps whatsoever. You will see and understand the purpose of every routine and every line of code! • Complete listing of equates to external label references. • Invaluable fully cross-referenced symbol table.

Order C-64 Source. $29.95 postpaid USA.

All orders shipped from stock within 24 hours via UPS. VISA/MasterCard welcomed.

BELIEVE IT OR NOT!

- A neutrino has neither mass nor a charge, but travels at the speed of light!
- A 1950 study predicted all computing in the U.S. through 1999 could be done by 5000 computers!
- An integrated program with the power of Lotus 1-2-3 is available on the C64!

Until now, while useful programs existed for the C64, you had to use different commands for each. Even worse, they couldn't share data. Now there *is* one integrated program with the power of Lotus 1-2-3: **VIZASTAR.** It has a spreadsheet, a database and graphics. It took Kelvin Lacy, who wrote the acclaimed "Omniwriter" for Hesware, 15 months to develop Vizastar. It is totally menu-driven and written 100% in 6502 machine code. You can go instantly from spreadsheet to database or graphics and data is shared by all. It is compatible with virtually all word processors and printers. All Vizastar commands can be automated, so you can create your own applications and run them with one keystroke. Bet you think, with integration must come compromises. Nope. Read on and decide for yourself.

Actual Screen Dump Printed by VIZASTAR

The VIZASTAR Spreadsheet

It is a full-featured spreadsheet, as powerful as Multiplan. But much faster — faster than many on the IBM-PC! Remarkably, 10K of memory is available for spreadsheet use. Below VIZASTAR is compared against the other leading spreadsheets.

	CALC RESULT	MULTI-PLAN	VIZA STAR
No. of Rows	254	255	1000
No. of Columns	63	63	64
Vary Indiv. Columns	NO	YES	YES
Date Calculations	NO	NO	YES
No. of Windows	2	8	9
Built-in Functions	21	39	33
Link Spreadsheets	NO	YES	NO
Sort	NO	YES	YES
Program Mode	NO	NO	YES
Money-back Guarantee	NO	NO	YES
Retail Price	99.95	99.95	119.97

The VIZASTAR Database

It is a fast, random-access database, with file size limited only by available disk space. Create file layouts by simply painting a picture of the layout on up to 9 screens, showing where each field starts and ends. Vizastar does the rest. You can modify the layout at any time. To process the data, you use the familiar environment of the spreadsheet.

The VIZASTAR Graphics

Open a window anywhere and display a high-resolution bar or line graph of spreadsheet or database data. Or display the data as a pie chart or spectacular, 3-D multibar graph.

"I have been using Vizastar daily. I find it is the most powerful spreadsheet on the market for the C64 and the only spreadsheet that I will personally recommend for serious use."

Richard Tsukiji, President, U.S. Commodore Users Group

"The power and design of Vizastar is spectacular. One of the "Best 5" software for the C64 of the 1000s I've seen."

Mike Hayes, Commodore Dealer

[Vizastar is] a phenomenal piece of programming which could turn the home computer market on its head."

California Magazine 2/85

RISK-FREE OFFER

VIZASTAR comes with a cartridge; a 1541 diskette with a backup, reference and tutorial manuals. The 50 page tutorial manual is full of examples and pictures, to guide you step-by-step. Vizastar is priced at *ONLY* $119.97. The power of Vizastar may be hard to believe, but its value is hard to beat. We are so positive you will be delighted with it that we offer a hard-to-believe 15 day Money-Back Guarantee. Try it Risk-Free. Call us today or send a check or Money Order. VISA/MC accepted.

Calif. Residents add 6.5% Sales Tax.

Add P&H: UPS-$4: COD/Canada-$7.

SIMPLE ANSWERS TO COMMON QUESTIONS

Tom R. Halfhill, Staff Editor

Q.A

Each month, COMPUTE!'s GAZETTE *tackles some questions commonly asked by Commodore users and by people shopping for their first home computer. If you have a question you'd like to see answered here, send it to this column, c/o* COMPUTE!'s GAZETTE, *P.O. Box 5406, Greensboro, NC 27403.*

Q. You often publish programs which require special POKEs to "protect BASIC" or "move the top of BASIC." Why do you have to do this?

A. Usually this is necessary to make room in memory for a machine language program without interfering with BASIC. Let's back up a bit to explain the problem in more detail.

When you write a program in BASIC, the computer takes care of a lot of picky details for you. Among these details is *memory management*—the process of making sure that memory conflicts are avoided. For instance, you might get upset if the computer suddenly decides that it needs a chunk of memory for some reason and appropriates a piece of the BASIC program you've been typing in for the last hour. Your program would be a jumbled mess.

To prevent things like that from happening, the computer keeps track of how much memory is available for BASIC programs. In effect, it draws an imaginary boundary between the end of BASIC memory and the beginning of remaining memory. This boundary is often referred to as the "top of BASIC." The computer also draws another boundary at the point in memory where your BASIC program starts—the "bottom of BASIC." Then the computer does everything it can to protect the BASIC program between these boundaries against internal interference.

If you stick to programs written completely in BASIC, you shouldn't have to worry about interference. But things get a little more complicated when you start working with machine language. Suddenly you're forced to accept responsibility for some memory management yourself. The computer doesn't automatically reserve memory for a machine language program in the way it does for a BASIC program. Furthermore, it is oblivious to any memory conflicts the machine language program may create—at least until a severe conflict causes the machine to "crash" or lock up.

Machine language programs that don't have to share memory with BASIC programs have more freedom. With BASIC out of the way, there's plenty of room in memory. However, some machine language programs are designed to work as subroutines of BASIC programs or to enhance BASIC itself (by adding new commands, for example). To coexist, the BASIC program and machine language must be protected against encroaching on each other. At the same time, room must be found in memory for the machine language. Often the solution is to "move the top of BASIC."

The top of BASIC boundary is controlled by two memory locations in the computer. A pair of numbers stored in these locations tells the computer where the boundary should be drawn. By changing these numbers with POKE statements in BASIC or equivalent commands in machine language, the top of BASIC can be moved at will—but only after careful calculations insure that a conflict won't result. Two other locations point to the bottom of BASIC; the beginning of BASIC memory can be moved up with POKEs to these locations.

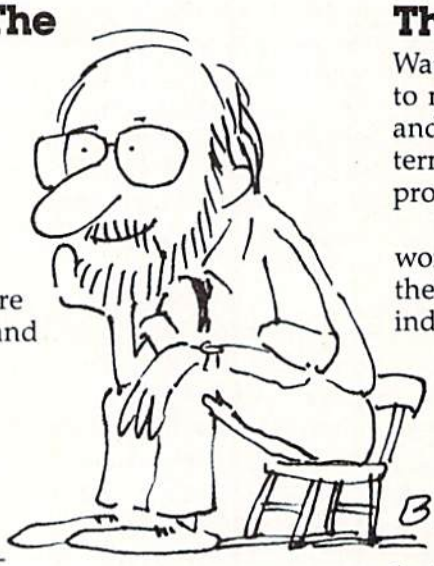
A typical example of moving the top of BASIC is when you type in certain machine language program listings with the MLX utility published frequently in COMPUTE!'s GAZETTE. MLX is designed to make it easier to enter machine language programs. However, since MLX is written in BASIC, some machine language programs can overwrite MLX in memory. The reverse can also happen: MLX can overwrite some machine language programs it's supposed to be helping you enter. To avert these disasters, sometimes the top of BASIC has to be moved downward, or the bottom of BASIC has to be moved upward. That's why the MLX instructions in some articles include a few POKEs you have to type before loading MLX.

Occasionally the top of BASIC is moved for other reasons than to make room for machine language. For instance, high-resolution screens, custom character sets, and sprites need memory for their data tables, and moving up the beginning of BASIC boundary to free up some extra memory is a common solution.

A Visit To Eric's Classroom

Fred D'Ignazio, Associate Editor

The Land Of The Lilliputians



Recently, I visited the classroom where my son Eric will begin the first grade this fall. Parents of this year's kindergarten class were encouraged to come and see how first graders spend their day.

The first thing I noticed in the classroom was how big I was and how little everything else was—people, chairs, tables, drinking fountains, and bookshelves. I'm a small person, so it was kind of a shock to feel like Gulliver in the wee land of the Lilliputians.

When I sat down in one of the tiny chairs recommended by the teacher, I sat down cautiously and nervously, fearing that I would crush the puny thing with my gigantic five foot seven body.

After a few minutes of acute discomfort, however, I began to relax. It wasn't long before I overcame my shyness and began roaming around the room, asking children what they were doing, examining work materials, and peeping over the teacher's shoulders as she conducted her reading groups.

I've often thought of schools as "learning factories." I saw kids going to school in massive numbers across our country, to process huge quantities of facts and basic skills.

When I visited Eric's school, I found out that I was right! Schools are factories. I was amazed, in the short time we were there, at the amount of material—the number of pieces of paper—those kids processed. It was exhausting just watching them.

The Paperless Classroom

Watching all those kids process paper, it occurred to me how neat it would be—both for students and teacher—to have little networked computer terminals at every table for the kids to do all this processing on.

I noticed that the kids already had their own workstations and were encouraged to work at their own pace. Computers could augment this independence and self-paced learning. Instant feedback, with helpful suggestions, encouragement, and a review of the lesson only a keystroke away.

And what a boon this would be for the kids' teacher who, I noticed, was accumulating stacks of paper. Instead of spending hours correcting papers, she would have time to look at summary statistics of the children's progress, or recall a transcript of each child's work, in any subject, and examine what was especially hard for the child to master.

What Software Is Available Now?

Is this fantasy of mine even close to happening in real classrooms with real teachers and children?

The right kind of software (drill-and-practice) *is* available. According to the 1985 edition of *TESS (The Educational Software Selector)* published by EPIE (Educational Products Information Exchange) and the Consumers Union, of the 7000 educational programs on the market, almost 70 percent are drill-and-practice. (For more about TESS, write: EPIE, P.O. Box 839, Water Mill, NY 11976; or call 516-283-4922.)

And it looks like teachers (and parents) are responding. A recent issue of *Billboard* shows that eight of the top ten best-selling educational programs were drill-and-practice. (The other two were learning games.)

But does this mean, then, that we're close to the paperless classroom?

The answer is a resounding NO. And there are many reasons why not. First, the quality of

DELUXE RS232 INTERFACE

Whether you want to communicate with a modem, serial printer, another computer, or any other RS232 device, the Deluxe RS232 Interface is the correct choice. Any comparsion will show that it is best Commodore compatible RS232 interface available for any price! The Deluxe RS232 Interface is the culmination of 3 years of working with Commodore users who need an RS232 Interface. It supports all standard RS232 connections (2-8, 12, 20, 22) including Ring Detect and Hi Speed Indicator. Four switches in the RS232 cover allow you to set the unit for virtually any standard RS232 configuration. The unit includes a 3 foot cable with either a male or female DB25 connector (specify which). RS232 plus and minus voltages. Users Manual includes a type-in Basic terminal program, basic program transfer routine, and other examples. Add $2.00 for shipping. Suggested retail $44.95.

PRINTMASTER/S (RS232)

This is an RS232 version of our famous Printmaster/+G. It is a serial bus printer interface providing full RS232 signals for an RS232 printer. Supports pins 2-8, 20. Select 300, 600, 1200, 2400, word, and parity. DTR or Xon-Xoff handshake. Supports dot graphics and characters on RS232 versions of Epson, Oki, Gorilla, NEC, and more. Includes all Printmaster Intellifeatures. Includes 3 ft cable with a male or female connector (specify which). Cassette or external power. Add $2.50 for shipping. Suggested retail $139.95.

BACKUP PROTECTED SOFTWARE with COPY II 64™

From the team who first brought you **COPY II PLUS** (Apple), **COPY II PC** (IBM) and **COPY II MAC** (Macintosh) comes a revolutionary new copy program for the Commodore 64, **COPY II 64**!

- Copies most* protected software — *automatically.*
- Copies even protected disks in just 3½ minutes.
- Maximum of four disk swaps on a single drive.
- Copies half and full tracks.
- Requires just one 1541 drive on the Commodore 64.

Call M-F 8-5:30 (W. Coast time) with your VISA : **503/244-5782.**
Or send a check (add $3 s/h, $8 overseas) to

$39.95

CENTRAL POINT Software, Inc.
9700 SW Capitol Hwy. #100
Portland, OR 97219

* We update Copy II 64 regularly to handle new protections; you as a registered owner may update at any time for 1/2 price! (To update, just send original disk and $20.)

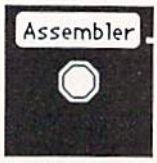
This product is provided for the purpose of enabling you to make archival copies only.

Trusted Software and

LANGUAGE SOFTWARE

ADA TRAINING COURSE
Teaches you the language of the future. Comprehensive subset of language. Includes: editor; syntax checker, compiler; assembler; disassembler, handbook. $59.95

ASSEMBLER/MONITOR-64
Macro assembler and extended monitor. Supports all standard functions plus floating point constants Monitor supports bank switching, quick trace, single step, more. $39.95



BASIC COMPILER 64
Compiles *complete* BASIC language into either fast 6510 machine language and/or compact speedcode. Supports overlays and many extended BASIC commands. $39.95

QUICKCOPY V2.0 NEW!
PROTECT Your DATA ... Backup your valuable data with the fastest disk copier we've seen to date. Copies entire disk in 2.5 minutes on two or 3.5 minutes on one 1541. $19.95

FORTH-64 LANGUAGE
Based on Forth 79 (+ parts of '83). Supports hires graphics and sound synthesizer. Full screen editor, programming tools, assembler, samples, handbook. NEW! $39.95

MASTER-64
Professional development package for serious applications. Indexed file system, full screen & printer management, programmer's aid, multiprecision math, royalty-free runtime, more. $39.95

PASCAL-64
Full Pascal supports graphics, sprites, file management, more. Supports pointers, dynamic memory management, machine language. Compiles to fast 6510 machine code. $39.95

VIDEO BASIC-64
Add 50+ graphic, sound and utility commands to your programs with this super development package. Free distribution of RUNTIME version - no royalties! $59.95

XREF-64 Basic cross-reference
Indispensible tool for BASIC programmer. Cross-references all references to variables, constants and line numbers. Sorts them into alphabetical order for convenient uses. $17.95

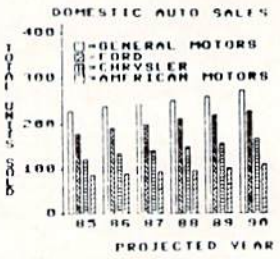
CHARTPAK-64
MAKE YOUR OWN CHARTS...
Professional quality charts and graphs instantly. Easy-to-use menus. 8 chart formats. Two size hardcopy. Accepts data from Multiplan, CalcResult. Supports statistical functions. $39.95
Also available:
CHARTPLOT-1520 fine output to inexpensive 1520 plotter. $39.95
CHARTPLOT-64 unsurpassed quality charts on most XY-plotters. $84.95



XPER-64 NEW!
SOFTWARE THAT LEARNS...
XPER is the first *expert system* for the C-64 and C-128. Ordinary data bases are good for reproducing facts, but by using XPER you can derive knowledge from a mountain of facts and make expert decisions. You first build the information into your *knowledge base* using XPER's simple loading procedures. Then, by using very efficient searching techniques XPER can easily guide you through the most complex decision making criteria. Full reporting. Currently used by scientists, doctors and professionals. $59.95

CADPAK-64
DETAIL YOUR DESIGNS....
Superb lightpen design tool. Exact placement using *Accu-Point* positioning; 2 complete screens; draw LINEs, BOXes, CIRCLEs, ELLIPSEs; pattern FILLing; freehand DRAW; screen COPY; ZOOM for detail. Two size hard-copy. Requires good quality lightpen. $49.95

SPECIAL FEATURE
SUPER C Compiler

```
atoi (s)    /* convert s to integer */
char s[];
{
        int  i, n, sign;
        for (i=0; s[i]==' ' || s[i]=='\n' || s[i]=='\t'; i++)
            ;       /* skip white space */
        sign = 1;
        if (s[i] == '+' || s[i] == '-')    /* sign */
            sign = (s[i++]=='+') ? 1 : -1;
        for (n = 0; s[i] >= '0' && s[i] <= '9'; i++)
            n = 10 * n + s[i] - '0';
        return (sign * n) ;
}
```

After many months in development, **SUPER C** is ready for the Commodore 64 and 128.

SUPER C's powerful screen editor is full-functioned and features horizontal and vertical scrolling, copy and search /replace for easy editing. Source files may be up to 41K.

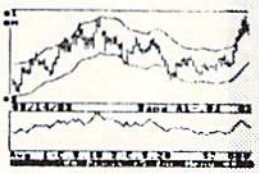
The **SUPER C** compiler is fast and creates link files. Up to seven separate modules may be linked into a ready-to-run object program. To maintain C's portability, **SUPER C** supports the Kernighan & Ritchie standard (without bit fields), making it very complete. **SUPER C** also includes a complete I/O library.

Other features of the SUPER C package:

- convenient hexadecimal and octal input
- error file listed to diskette
- supports conditional compiling
- complete strings and arrays
- full mathematical functions

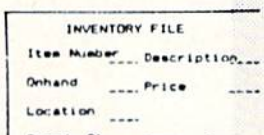
$79.95

TAS-64
CHART YOUR OWN STOCKS...



Sophisticated technical analysis charting package for serious investor. Capture data from DJN/RS or Warner Services or enter and edit your data. 7 moving averages, 3 oscillators, trading bands, least squares, 5 volume indicators, relative charts, much more. Two size hardcopy. **$84.95**

DATAMAT-64
ORGANIZE YOUR DATA...



Powerful, easy-to-use data management package uses menu selections. Free form design: 50 fields/record; 2000 records/disk. Sort on multiple fields in any combination. Complete selection and formatting for printing reports. **$39.95**

TEXTOMAT-64
WORD PROCESSING.....

Flexible wordprocessor displays 40 or 80 columns with horizontal scrolling. Menu selections make TEXTOMAT easy to use. Quickly move from editing to formatting to merging to utilities. Supports virtually any printer. Can support foreign languages. **$39.95**

POWER PLAN-64
SUPER SPREADSHEET WITH GRAPHS...

Powerful software includes built-in 2D & 3D pie, bar and line charts from your worksheet. Features cell formatting and protection, split screen, math functions, manual calc, much more. **$49.95**

Gazzette 8/85

this software (as journalists and educators so widely lament) is mostly very low. According to *TESS*, only four of ten educational programs are even worth buying, and one or two of these are simulation or problem-solving programs, not drill-and-practice.

Second, and perhaps more important, very little of the drill-and-practice software fits the teachers's or child's needs. Most programs on the market exist as one-shot products that drill children in a very narrow area. When a teacher looks at educational programs, it seems she's faced with an array of mediocre products that cannot easily be integrated into her curriculum. So what is she to do?

It looks to me like she has three choices. First, she can experiment and try to squeeze available programs into her curriculum, while recognizing that in most cases they'll be a poor fit. Second, she can wait until software and educational publishers link forces and produce quality software that's fully integrated into her curriculum. Or third, she can develop her own materials.

Available Programs

Fortunately, software on the market is improving. The CBS Success with Math Series, the Davidson & Associates programs, Scarborough's *MasterType*, Simon & Schuster's *Typing Tutor III*, and Springboard's *Early Games* are examples of quality software that make the computer a learning medium. Although these are basically narrow, one-skill programs, they are well-designed, pedagogically sound, and quite appealing. Also, they offer ways to custom-fit the lessons to a teacher's needs, and they offer limited evaluation and progress-report facilities for each learner.

In addition, a new generation of powerful, yet easy-to-use productivity software for children is available: word processors like *Quill* from D.C. Heath, *Magic Slate* from Sunburst, the productivity series from Grolier (*Friendly Filer, EduCalc,* and *Easy Graph*), and Scarborough's *MasterType's Writer* and *MasterType's Filer* are examples of this new generation.

Computers In The Curriculum

However, even if software quality improves, we still need to see an explicit connection between a teacher's curriculum and the programs she has available.

As a start, textbooks should refer to specific software and vice versa. Computer disks and computer-learning units should be included in every textbook. A teacher won't be forced to use these, but if she chooses to, they should enable her advanced students to explore a topic in more depth, and provide self-paced practice for those who need more work.

On the other hand, new curriculum-based (or at least, curriculum-supportive) programs are appearing on the market. One of the best is the family of "Intelligent Tutor" programs produced by Intelligent Software (9609 Cypress, Munster, IN 46321; 219-923-6166), which include five math programs targeted to older children: *Algebra I, Geometry, Algebra II,* and *Trigonometry* parallel the standard high-school math curriculum; and *SAT Math* helps students prepare for the math portion of the SAT exam.

A Successful Alternative

More and more teachers are also choosing the third route and creating their own software and materials for integration into their curriculum. This is not as simple as it sounds. Few teachers, alone, have the time or expertise to develop a battery of materials or programs and then plug them into their daily schedule.

But an entire school system—in a city, a county, a state, or province—can do this. I found this out when I visited the city school system in Vancouver, British Columbia. Under the active guidance of Mike Northy, the District Elementary Computer Consultant, the school system is developing a rich library of programs, books, and other materials to feed into the city's elementary schools. (For more information, write to Michael L. Northy, Education Services Group, Board of School Trustees of School District No. 39 [Vancouver], 1595 W. 10th Avenue, Vancouver, B.C. V6J 1Z8 CANADA; or call 604-731-1131.)

The Teacher: The Real Key

The Vancouver program is successful because Mike has patiently worked with individual schools and parent-teacher associations to develop grass-roots support, and because the city is big enough to provide a pool of talented teachers who can jointly develop the materials and enough classrooms, teachers, and students to make it all worthwhile.

But the real key to Vancouver's success, I believe, is the teachers themselves. My old image of the "factory classroom" placed the teacher as supervisor or foreman. She does act as a fact-and-skill-processing manager, but there are other things she does that far transcend this role and make her an invaluable part of my son Eric's (and all children's) school experience. Most important of all is her style of teaching and the warm, person-to-person attention I saw one of the teachers lavish on each child in her class when I visited Eric's school. Now, after visiting Eric's classroom and seeing his future teachers in action, I'm convinced that a teacher is much, much more.

Michael S. Tomczyk

The Art Of Repetition In BASIC

Michael S. Tomczyk is a former Commodore marketing executive and product designer. His recent book, The Home Computer Wars, *describes the rise of Commodore and is published by COMPUTE! Books.*

This month we're going to look at some of the many ways to repeat actions in BASIC programs. And choosing the right way can be an art.

You might notice that I often repeat a particular programming tip in different forms to help explain it better. In BASIC, you can use repetition in a lot of different ways:

Repeating certain graphics symbols makes a long line across the screen.

Repeating the use of a variable allows you to use it in different ways.

Repeating an action a specified number of times is easy with FOR-NEXT.

Repeating a complex action or calculation can be used with a GOSUB.

Repeating, The Hard Way

The clumsiest way to repeat an action in BASIC is to type the command over and over. But this wastes memory and also makes you do a lot of unnecessary typing. You could type the following program like this:

```
10 PRINT "**********************************
   *********"
20 PRINT "COMPUTE!'S GAZETTE"
30 PRINT "**********************************
   *********"
40 PRINT "COMPUTE!'S GAZETTE"
50 PRINT "**********************************
   *********"
60 PRINT "COMPUTE!'S GAZETTE"
70 PRINT "**********************************
   *********"
80 PRINT "COMPUTE!'S GAZETTE"
```

Lines 10, 30, 50, and 70 print 40 SHIFTed asterisks. VIC users should type only 22 SHIFTed asterisks.

You could do the same thing by doing this (VIC users should change 40 to 22 in this and subsequent examples):

```
10 FOR X=1 TO 4
20 FOR G=1 TO 40: PRINT "*";: NEXT
30 PRINT "COMPUTE!'S GAZETTE"
40 NEXT
```

One program looks clumsy and takes eight lines. The second program does the same thing in only four lines and with a lot less typing. We'll come back to this example in a moment. First, here's a quick list of the most common methods to repeat actions in BASIC:

1. Type the command over and over.
2. Use a GOTO to move to a line and repeat it.
3. Wrap an action you want to repeat in a FOR-NEXT loop.
4. Use a GOSUB to insert the action where you want it.

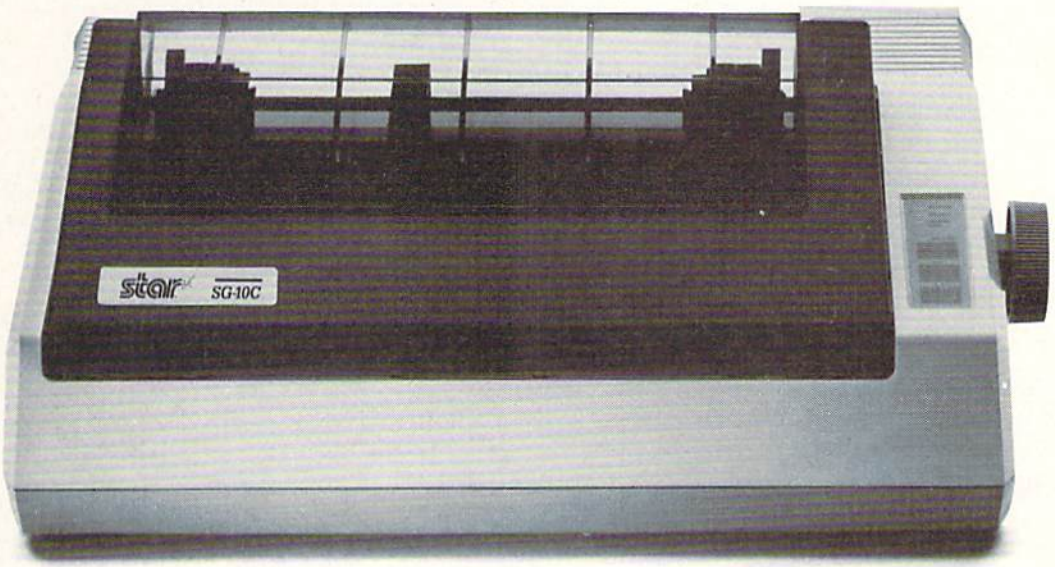
GOTO And The "Infinite" Repeat

Most of you will be familiar with the following example, which displays a message over and over again. Enter the program, then type RUN and press RETURN:

```
10 PRINT "ALBERT EINSTEIN"
20 GOTO 10
```

Line 10 displays the message, in this case the name of our century's most famous scientist, and line 20 tells the computer to go back to line 10 and print it again. This program is called a *loop* because it keeps "looping" back to do the same thing over and over again. To break out of

A BRIGHT NEW STAR FOR A COMMODORE TO PRINT BY



Now you can own a sophisticated, affordable printer that's made just for your C-64:™ Star's new SG-10C.™

Here's a dual-mode Star printer that delivers 120 cps draft/30 cps *near-letter-quality.* With an ample 2K memory capacity. Interface cable. And friction and tractor feed. All standard.

The SG-10C is Star's made-for-Commodore® printer. Made to be the easiest to interface. Made with more features (no add-ons necessary—just plug into your computer and go to work). And made at a price that can't be beat. There just isn't a better mate for your Commodore.

You've got the computer. Now get everything out of it. Get the Commodore-dedicated SG-10C from Star. It's the best connection you'll ever make.

Commodore and C-64 are trademarks of Commodore Business Machines, Inc. and/or Commodore Electronics Ltd.

star®

THE POWER BEHIND THE PRINTED WORD®

200 Park Avenue, New York, NY 10166
Chicago, IL (312) 773-3717 • Boston, MA (617) 329-8560
Irvine, CA (714) 586-8850

the loop you have to press the RUN/STOP key. The program displays the message in a vertical column because each new PRINT statement is automatically put on a new line, *unless* you add a semicolon at the end of line 10. The semicolon (;) is like "glue." It makes printed messages occur right after each other, in a running stream.

You can put a GOTO on the same line as the command you want to repeat. Here's the same example on one line (with the semicolon inserted):

```
10 PRINT "ALBERT EINSTEIN ";: GOTO 10
```

Using the GOTO command to go back to the same line has some special uses. For example, you can use it to make the computer stop and wait until a key is pressed, like this:

```
10 PRINT "{CLR}ALBERT EINSTEIN": PRINT: P
   RINT "PRESS ANY KEY TO GO ON."
20 GET K$: IF K$="" THEN GOTO 20
30 PRINT "ALBERT EINSTEIN ";: GOTO 30
```

Line 10 clears the screen and displays Einstein's name. The PRINT command all by itself puts a blank line on the screen (in other words, skips a line). Then we print an instruction to the user.

Line 20 uses the GET command to tell the computer to look for a key to be pressed. The IF-THEN statement sets up a condition which tells the computer IF no key is pressed ("" in this case means "no key"), THEN keep going back to the same line and check to see if a key is pressed. The trick here is that if any key on the keyboard *is* pressed, line 20 stops going back to itself and the program "falls through" to the next line. Remember, if no key is pressed, the program stops and waits. If *any* key is pressed, the program drops through to the next line.

Line 30 displays Einstein's name over and over. Press RUN/STOP to break out of the "loop," then type NEW and press RETURN to erase this example and get ready for the next one.

Repeating Actions With FOR-NEXT

The FOR-NEXT command is the most common way to repeat actions, especially when you want to specify exactly how many times an action should repeat. The important thing to remember about this command is that everything *between* the FOR and the NEXT command will be repeated as many times as you specify. Here's a simple example:

```
10 FOR X=1 TO 10:PRINT"ALBERT EINSTEIN":
   NEXT
```

Type RUN and press RETURN. The first part of the command tells the computer it's going to do something ten times. Then we insert the command we want to repeat—in this case printing Einstein's name—followed by the NEXT command.

The way this works inside the computer is that the variable X starts out with a value of 1 and prints Einstein's name. When the computer reaches the NEXT command, X is increased to 2, and Einstein's name is printed again, and so on until X reaches its upper limit—in this case, 10. Then, X becomes 11, the computer realizes that 11 is beyond the limit (10) we gave it, and the program continues. Try changing the numbers 1 and 10 and run the program again to see what happens.

The variable X can be named anything you choose: a letter (A,B,C), two letters (AB,AX,XY), or a letter and a number (A1,X4,M2). The range of numbers can also be changed. If you type FOR X=6 TO 15, Einstein's name will still print ten times. If you type FOR X=41 TO 60, Einstein's name will print 20 times.

REM: *The STEP command lets you skip numbers in a FOR-NEXT sequence, and also lets you "step" backwards through a number sequence. Here are some examples to try:*

```
10 FOR X=1 TO 20 STEP 2:PRINT"EINSTEIN":NEXT
10 FOR X=1 TO 20 STEP 2:PRINT X:NEXT
10 FOR X=20 TO 1 STEP -2:PRINT X:NEXT
10 FOR X=20 TO 1 STEP -1:PRINT X:NEXT
```

This is especially useful when going up or down a musical scale or in creating a sound effect which pops up or down through the scale of notes, by STEPing 2, 5, 10 or however many notes at a time—either up from a low note to a high note, or down from a high to a low note. When you go down from a higher number to a lower number, STEP a negative number like STEP −1, STEP −5, and so on.

You can also use FOR-NEXT to repeat a graphics symbol, like this:

```
10 FOR G=1 TO 40: PRINT "*";: NEXT
```

This is a convenient way to draw a horizontal line across the screen. It simply prints the single short line symbol 40 times (22 if you have a VIC) to make a long line across the screen.

You can also wrap several program lines in a FOR-NEXT loop, like this example which we used at the beginning of the column:

```
10 FOR X=1 TO 4
20 FOR G=1 TO 40: PRINT "*";: NEXT G
30 PRINT "COMPUTE!'S GAZETTE"
```

```
40 NEXT
50 PRINT: PRINT "CONTINUE REST OF PROGRAM
   "
```

Line 10 starts the FOR-NEXT loop. Everything between this line and the NEXT command in line 40 is repeated four times.

Line 20 contains our graphics line loop, which puts a long line across the screen. Line 30 prints the message.

Line 40 tells the computer to increase the variable X by one and run through the program again. When the X becomes 4, and the fourth cycle is completed, the program continues to line 50 and goes on to the rest of your program.

Using FOR-NEXT Variables To Count

As we've learned so far, the FOR-NEXT loop makes program actions repeat because the computer increases the variable each time it cycles through the loop. You can make use of this variable in many ways, just like any number. Try this example:

```
10 FOR N=1 TO 10:PRINT N:NEXT
```

Here, we define the variable N as a range of numbers from 1 to 10. We can use this to print the value of N. Since the value of N changes, from 1 to 10, the computer prints the value and counts from 1 to 10. You can also use this method for calculations, like this:

```
10 FOR N=1 TO 5:PRINT"2 TIMES"N" EQUALS"
   2*N:NEXT
```

Here, we print the message "2 TIMES" inside quotes, then go outside quotes to print the value of N (which is 1, 2, 3, 4, and 5), then the word "EQUALS" inside quotes, and finally we go outside quotes to print the result of a calculation (1*5, 2*5, 3*5, 4*5, and 5*5).

Here's another variation:

```
10 FOR N=40000 TO 100000 STEP 10000:PRINT"12
   TIMES"N" EQUALS "12*N:NEXT
```

Here's another variation which combines a PRINT message with the use of the FOR-NEXT variable:

```
10 FOR N=1 TO 10:PRINT" {CLR} EINSTEIN...
   REPETITION"N:NEXT
```

Using GOSUB To Repeat Actions

What if you want to repeat an action several times, but in different parts of your program? Here's where the GOSUB command comes in handy. Try the following short example:

```
10 PRINT "{CLR}EINSTEIN OUTDATED NEWTON..
   .": GOSUB 100
20 PRINT "BUT WHO WILL": GOSUB 100
30 PRINT "OUTDATE EINSTEIN...?": GOSUB 10
   0
40 GOSUB 100: GOSUB 100: GOSUB 100
50 END
100 FOR G=1 TO 40: PRINT "*";: NEXT: RETU
    RN
```

Here we want to print three short messages on the screen and separate them with horizontal lines, but instead of typing the "line-making" line over and over again, we use a GOSUB to jump down to line 100 and use it over and over again.

Line 10 clears the screen, prints our message, and GOSUBs to line 100. Line 100 displays a horizontal line on the screen, and the RETURN command sends the computer back where it came from—the end of line 10—so it continues on to line 20.

Line 20 prints another message, GOSUBs to line 100 to print the horizontal line, returns to the end of line 20, and continues on to line 30, which does the same thing.

Line 40 is included to show you that you could use the GOSUBs by themselves to put several lines on the screen.

A GOSUB can be used for many different purposes. In this next example, we use it to make the computer choose six random numbers from 1 to 40. We'll call this program a "lottery."

```
10 FOR L=1 TO 6: GOSUB 100: PRINT "LOTTER
   Y NUMBER"L"IS"R
20 NEXT
50 END
100 R=INT((RND(1)*40)+1): RETURN
```

Line 10 is a FOR-NEXT loop which counts from 1 to 6. The GOSUB is inserted here so the random number in line 100 is chosen before we have to use it. The random number (R) is printed at the end of the message. Line 100 chooses a random number from 1 to 40 and RETURNs.

Line 20 contains our NEXT command.

Line 50 ends the program.

REM: *If you put subroutines at the end of a program, you should separate them from the main program with an END statement. Otherwise, the program "falls through" to the subroutine and executes it once. Then, the RETURN causes a RETURN WITHOUT GOSUB error. Try deleting line 50 to see how this can happen.*

Repeating actions are fundamental to nearly every program. As we've seen here, there are various ways to accomplish the same thing, but some are more efficient than others.

MACHINE LANGUAGE FOR BEGINNERS

Richard Mansfield, Senior Editor

Crossing

If you're already good at BASIC, then you've seen the wall that prevents you from getting better. There's only so much you can do to improve the speed of your programs in BASIC—and it can be a considerable effort to squeeze a little extra efficiency out of a language which has very definite limits.

That's one of the main arguments for making the leap and crossing over to machine language. ML can be a hundred times faster than BASIC. But what only ML programmers know is that ML isn't really that difficult or that mysterious. It just seems obscure at first because it uses different command words and builds programs a different way. However, once you know the few underlying rules that distinguish ML from BASIC, you'll wonder why you put off learning ML. It's not hard and it's the only way to take your programming to the max.

If You Know BASIC

If you know how to communicate with your computer in BASIC, you know how to construct loops and branches and variables. ML, too, is based on loops and branches and variables. ML does the same things that BASIC does, you just write the program instructions differently.

Let's take a simple BASIC program that defines four variables, prints a prompt message, gets input from the user, branches to print out the correct response message, and then loops back for more input. This is pretty simple, but it illustrates how variables, input, output, looping, and branching are accomplished in both BASIC and ML. By comparing the methods, you'll learn a good deal about how ML works and begin to see that there's nothing inherently difficult about ML.

Program 1: BASIC Version

```
10 NE$ = "MESSAGE #1"
20 TWO$ = "MESSAGE #2"
30 THREE$ = "MESSAGE #3"
40 PROMPT$ = "PLEASE ENTER A NUMBER BETWEEN
   1 AND 3.  HOWEVER, EXIT THIS
50 P1$ = "ROUTINE WITH ANY OTHER NUMBER."
100 PRINT PROMPT$;P1$
110 INPUT A
120 IF A = 1 THEN PRINT NE$:GOTO 100
130 IF A = 2 THEN PRINT TWO$:GOTO 100
140 IF A = 3 THEN PRINT THREE$:GOTO 100
```

Now let's see what the ML program would look like. To write ML, you can write a series of instructions, much the way you would write a BASIC program. You can even use colons to separate instructions just as BASIC does (see line 100 in Program 2).

There's one extra step to ML, however, that you must take after you've written the program. The ML you write has to be translated from your instructions (called *source code*) into a real, runnable ML program (called *object code).* This translation is done for you by a program called an *assembler.* That's a special program which doesn't come with the computer; it's not inside waiting for you to type RUN the way BASIC is. Instead, you must buy an assembler. There are several available for Commodore computers, but I'll use the LADS assembler from my *Second Book of Machine Language* in the following example.

Here's the ML equivalent to the above BASIC program:

Program 2: Machine Language Version

```
10 *= 828
20 .o
30 ;
35 ;                    --- LABEL ASSIGNMENTS ---
36 ;
```

ALL OF A SUDDEN

Statement: All of a sudden some of our competitors have made astonishing technical and pricing breakthroughs. Breakthroughs?

Fact: At DSI we believe in designing and pricing a product *properly* from the beginning so that you don't have to scramble for breakthroughs later.

Gee whiz, don't flog a dead horse.

Commodore 64

One Megabyte Disk Drive

Super Summer Sizzler Sale $179 **Super Summer Sizzler Sale $179**

Store Spreadsheets, Databases, Wordprocessing Data, Etc.

• Commodore 64 • PET • 8032 • B128

The one megabyte disk keeps you from hunting through hundreds of disks for your programs; plus running out of room on your drive for Data base Data, Word processing Text, Spreadsheet Data, Business program Data, etc. With the One Megabyte Disk Drive you can store over **5½ times the capacity of the 1541**. You can store your own programs and any back-upable commercial programs plus data from your business programs*. Perfect as a second Drive!!!! Enter the world of professional computers today. *C-64 requires IEEE interface.*
List $899.00. **Sale $179.00.** ***LIMITED QUANTITIES!***
*Requires 2 drive software.

Notice first that in BASIC you need to define your variables at the start of the program. BASIC has to know what these variable names NE$, TWO$, and THREE$ mean before it can use them. (By the way, because the variable name ONE$ would confuse the computer since the command word ON is embedded, we had to shorten the name to NE$.)

More Intimate Terms

As you see, it's not necessary to assign variables at the start of an ML program. In practice, most ML programmers put all their data at the end of the ML program. And variables are just another kind of data in ML.

With ML, we're on more intimate terms with the computer. We're more in charge of managing the data and the variables than we are in BASIC. This requires that we do things a little differently, but we have far more control over how things are formatted and manipulated. We give a variable a name by assigning a label to it as in line 510 of Program 2. Just type in the label as the first thing after the line number. Next, the .BYTE is a command to the assembler (such commands are called *pseudo-ops*) to insert the following characters into RAM at the address where the label ONE starts. The string starts and ends with quotes, just as in BASIC.

What if it's a numeric variable? Simple. Line 520 stores the numbers 13 and 0 in RAM right after the message in line 510. We could have given a label to line 520, but we didn't need to since we're going to consider the 13 0 as part of the message (we'll see why in a minute).

Likewise, all the rest of our strings are stored following the first one. They don't need to be in any particular order—they'll be referenced by their label. But messages and data shouldn't be stored *within* the actual ML program (at line 125, say) since messages are not proper instructions to the computer and the 6502 chip wouldn't be able to understand what to do. So put messages at the end.

There's Less Than Meets The Eye

By the way, there's a lot more in Program 2 than ever gets POKEd into the computer as runnable object code. Labels, line numbers, comments, pseudo-ops like .BYTE—none of these things will end up in the finished program. They are conveniences to the programmer, they make writing ML simpler, but the assembler will strip off all these things when it transforms the source code (Program 2) into the object code (Program 3). It's the object code that you SYS to when running an

ML program. And it's only object code that the computer itself can understand.

How do you insert REMarks into an ML program? It works just like REM, except you use the semicolon (;) with LADS and some other assemblers. Anything following the semicolon on a line is ignored by the assembler.

What are those variable-looking items up in lines 40–60? They aren't actual data like messages to be printed out. They're a different kind of label assignment, but they do assist the programmer. There are many built-in routines in BASIC, in the ROM memory, which are easy to use from ML. After all, BASIC itself is written in ML. Rather than reinvent the wheel, an ML programmer will freqently use built-in routines by simply JSRing (Jump to SubRoutine) to them as he would to any other subroutine. Some of these activities, like printing and disk I/O can get pretty complex. It's convenient to "borrow" routines from BASIC from time to time.

Thus, a routine which prints a string (after you first put its address in the Accumulator and the Y register) is located at $AB1E in the 64. So at the start of the program, we define the label PRINTSTRING to mean the address of that routine. Then, anywhere in the program (see line 120) that you want to access this routine, you just type JSR PRINTSTRING. You don't need to remember specific addresses this way, and the programming becomes more BASIC-like, with real words for commands.

The ML program proper starts at line 100 with the label LOOP. LOOP identifies the address where the command LDA on that line is located in memory and the address to which we can later JMP (JuMP) to the LOOP. As when naming variables in BASIC, you can use any words you want for labels. You just can't use the same word twice. (If you do, LADS will ring a bell and print "Duplicated Label" to let you know.)

There's another interesting thing in line 100: the #< pseudo-op. To satisfy the needs of the PRINTSTRING routine, we need to divide the address of the string we want printed into two bytes and then put the high byte into the Y register and the low byte into the Accumulator. You break an address in half like this:
#<PROMPT, which gives you the low byte, and
#>PROMPT, which gives you the high byte.

How Does It Know When To Stop?

How, you might ask, does the PRINTSTRING routine in BASIC know when to stop, know when it has reached the end of a message? That's where those bytes 13 0 we spoke of earlier come in. PRINTSTRING stops printing to the screen when it comes upon a 0. The 13 is the symbol for the carriage return and that's an easy way to print one: Just add it to a string you want printed.

GETKEY is another BASIC subroutine and so is PRINT which prints one character—whatever is in the Accumulator—at the time you JSR to it.

GETKEY acts like BASIC's INPUT command and the character typed will be left in the Accumulator when we return to our ML program from GETKEY. Thus, we can transform the ASCII code for numbers into actual numbers by using the AND #$0F in line 105. ASCII for 1 is $31, for example. After $31 AND $0F, we're left with a 1 in the Accumulator. It's not important for now that you understand how this or GETKEY or PRINTSTRING accomplish their tasks. Just learn what they do and how useful they can be when programming.

In fact, we didn't really need to strip off the $3 from $31. We could have constructed the branch test in line 110 to CMP $31, but it's easier to visualize what's happening if we test the real numbers instead of their ASCII code. The BNE (Branch if Not Equal) in line 110 will send the program down to line 130 (for another IF-THEN test) if the number in the Accumulator is not equal to 1.

However, if the number *is* 1, we "fall through" the BNE to line 120, which prints out our message for keypress 1 and then jumps back up to start the loop over again and prompt the user for more input.

The only subroutine we've written for this program is one which prints a carriage return just after we've detected a keypress with GETKEY. Obviously, we want to save what's in the Accumulator after GETKEY because we need to use it to test for 1, 2, or 3. To save the Accumulator, we PHA (PusH Accumulator onto the stack) and then print a 13 and then PLA (PuLl Accumulator from the stack) so that we can preserve the original GETKEY value. We needed to use the Accumulator briefly, and without saving whatever was in it, we would have lost it. In ML there are many ways to save the Accumulator, many ways to print string variables, many ways to do most anything. But the techniques illustrated here work well.

One final observation: The source code in Program 2 illustrates the general structure used by most ML programmers. It separates the program into four fundamental sections: the Definitions and Initialization (lines 35–60); the Main Loop (100–170); the Subroutines (430); and, last, the Data 510–590). There are no fixed rules about this in ML, but most programmers find this arrangement is the most efficient.

REVIEWS

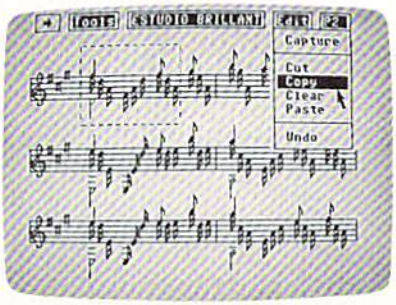
The Music Shop

"*The Music Shop*," written by Don Williams for Brøderbund, is a powerful, thoughtfully designed music editor for the Commodore 64. If you've never tried programming a computer to make music, it's hard to appreciate just how much *The Music Shop* simplifies the process: It works in such a natural, intuitive way that you can start making "real" music within minutes of booting it up. This is due in large part to the program's intelligent use of Macintosh-style visuals.

Nearly every *Music Shop* function can be performed with a joystick (keyboard controls are also available), guiding an arrow-shaped cursor around a screen display that looks like a sheet of music paper. For instance, to choose a note, you open the "Notes Box" and take what you want from a wide selection of musical symbols. Press the button and the box disappears, putting you back on the music paper. Now the cursor is "carrying" the selected note, which plays at the proper pitch when you place it on the musical staff.

After you've placed a few different notes, you can use your own composition like the Notes Box, picking up new notes from existing ones without disturbing the originals. Thus, you need only to go back to the Notes Box for something that's not already on the screen.

The rest of the program has the same visual orientation, letting you move around in the composition to add, delete, or revise small details or large passages with equal ease. Compositions can be saved or loaded from disk, or sent to a Commodore-compatible printer. The program disk also contains an impressive selection of demonstration musical pieces.



The Music Shop provides 16 predefined instruments, and you can switch any of the 64's three independent voices from one instrument to another at will. But the real fun is in making your own customized musical instruments. This is done with "Adjust Sound," a full-featured sound effects editor that lets you adjust the sound of an instrument *while your composition plays in the background.*

Besides being lots of fun, it's intriguing to listen to the same song played by a variety of different instruments, switching from one to another with the touch of a button. Once you've defined a new instrument, you can use it at any point in the composition, just like one of the presets. And the instrument definitions are automatically saved as part of the composition.

On the negative side, if you're one of those who dislikes icons and pull-down window menus (some people find them obtrusive and irritating), this program may not be for you. After a while you may tire of moving the cursor all the way across the screen to select new options. Though it's possible to choose options with shorthand keyboard commands (pressing f2 puts you in the Adjust Sound option, and so on), there's no way to escape the omnipresent windows. In addition, since it's designed for writing fairly conventional music, the program is not suitable for creating sound effects. But for most people, these are likely to be insignificant drawbacks to a generally exceptional product.

The Music Shop includes an excellent instruction manual containing step-by-step tutorials as well as a quick reference card. For those who need to brush up on fundamentals, there's even a section on basic music theory.

Felony

Once again it's time for you, in the role of a master detective, to take to the city streets. Your job is to solve the 12 crimes which make up *Felony*, the second scenario in CBS Software's Mystery Master Series.

Like its successful predecessor, *Murder by the Dozen*, *Felony* is an attractive, intriguing, and challenging software package that contains all the paraphernalia needed to crack each of the cases. Unlike *Murder by the Dozen*, in which all the cases centered on murders, the cases in *Felony* vary considerably, necessitating that your investigative techniques vary accordingly. Motives for theft, for example, can differ considerably from motives for murder, and your methods of investigation will reflect the type of case you're trying to solve.

Less convoluted than some other mystery games, *Felony* is no less enjoyable and often just as

diabolical in its logic. Each crime is supported by a Case History that provides you with the necessary data to begin working on the case. Players (up to four detectives on each case, more if you wish to play in teams) may interview people, examine physical evidence, or move to another location on each game turn. Each option carries with it certain advantages and disadvantages, and it takes a top-notch sleuth to know when to do what, sift through the red herrings, and make good use of time.

While there is no time limit on solving each case, your final detective rating is based in part on how long it took to solve the case. To meet the objectives of each case (as stipulated in the Case History), you must be sure that you've spent enough time gathering evidence that will support your solution, yet not so much time that you've bankrupted the city with your overtime pay.

The computer acts as your crime lab, the map of the city (there are functional graphics), and option generator. It not only does the busy work of keeping track of whose turn it is, but also the necessary work of analyzing the evidence you've sent to the lab. Most importantly, it sends you to the proper section of the Clues Booklet, which contains the information necessary for building your case and eventually solving the crime.

Felony is an excellent example of an educationally sound game. Players exercise logic and reasoning skills, learn to both take and organize notes, and to employ other problem-solving skills. The cases are well thought-out, each as difficult in its own way as the next, and they accurately reflect the problems and anxiety that must accompany painstaking detective work. The competitive factor, brought on by working against rival detectives trying to solve the same crime, adds another dimension to *Felony*, though the game is equally enjoyable when played alone. This is a good one for all the would-be Sherlocks out there.

a Breakthrough in Value!

ULTRABYTE

NEW PRODUCTS - ALL with FREE BACKUP COPIES

ULTRABYTE DISK NIBBLER

Uses proprietary revision of disk operating system (DOS) to make a bit by bit copy. This process, called nibbling, copies the format, data and errors, all at the same time. Errors are not recognized and do not hammer the drive. Built in fast load environment allows copies in 8 minutes with a single 1541 disk drive.

- Easy to use. No separate analysis or error production
- Choose 35, 36, 37 or 38 tracks to copy incl. half tracks
- Makes up to 5 copies of each original — (UNIQUE FEATURE)
- Backs up 99% of all protected software
- Free backup copy - two disks for the price of one

$39.95 FOR 2 COPIES OF THE DISK NIBBLER

plus $4.00 shipping and handling. Mastercard, Visa, Check or M.O., Foreign orders or COD add $2.00. Calif. add 6.5% ($2.60) sales tax. Additional backup copies are $20.00 plus $3.00 shipping. ATTENTION: Owners of ULTRACOPY whose names are in our file may order a single copy for $20.00 plus $3.00 shipping.

FREE BACKUP DISKS

McMURPHY'S MANSION

New AN ULTRABYTE TEXT ADVENTURE

It seems that an unknown uncle has died in faraway Scotland and left you his vast fortune. $10,000,000 to be exact !!

There is only one small problem. Dear old uncle McMurphy was a bit demented and has hidden your inheritance somewhere in his mansion.

He left you only one small clue, a brass key.

It is now up to you to find your fortune.

- 30 - 60 hours of challenge
- Sealed envelope of hints for beginners
- Instruction manual included
- Solution sheet available

$29.95 for 2 disks plus $4.00 shipping. COD or Foreign add $2.00. CA tax $1.95

THE DISK SURGEON

New AN ULTRABYTE DISK UTILITY

- Read data from, edit and write to disk
- Analyze disk errors without "hammering"
- Write errors 20, 21, 22, 23, 27 & 29 on disk
- Read data under errors, erase errors
- Decimal, HEX, Octal & Binary conversions
- Format a single track with any ID
- Detailed instructions for beginners
- Much more

INCLUDES THREE PUBLIC DOMAIN COPY PROGRAMS THAT ARE NOT PROTECTED

1) FILE COPY to copy portions of a disk
2) SINGLE TRACK COPY
3) 4 MINUTE COPY of entire disk. Protected disks also require error production

$29.95 for 2 disks plus $4.00 shipping. COD or Foreign add $2.00. CA tax $1.95

Mixing Text And Hi-Res Graphics

James R. Chambers

You've created the perfect graph in hi-res, but how are you going to label it? Here's a program that allows you to put standard text characters on the hi-res screen of the 64. Also, it's compatible with "Hi-Res Toolbox."

Once you start writing hi-res programs, you may find yourself wishing for just a few regular characters. Perhaps you want some labels for a detailed graph or a player's score display for a game with a hi-res screen. I've read about creating text windows using a raster interrupt vector routine written in machine language. I haven't tried this, but apparently the text is limited to certain portions of the split screen—you can't mix characters and hi-res graphics.

One solution is to create a brand new character set, but why do all that work when there's a character set already in memory? And because of the organization of hi-res memory, we can put character shapes there without a lot of complex math.

Eight Byte Chunks

In some important ways, a hi-res screen is similar to a regular screen (see "Creating Hi-Res Graphics On The 64" in this issue). Each character on a normal screen is made up of eight lines of eight pixels. Information about letter shapes is stored in character ROM—eight bytes per character. Not so coincidentally, the memory used for hi-res bitmapping is divided into 1000 groups of eight bytes.

So, if you were to go through character ROM and PEEK the shapes of the letters C, A, and T, and then POKE the 24 numbers into the first 24 bytes of hi-res memory, the word CAT would appear. This is the principle behind the program offered here, "Text Print."

Instructions And Modifications

Enter the program and save it to tape or disk. Make sure the numbers in the DATA statements are all typed correctly.

When you run the program, you see a horizontal, a vertical, and a diagonal hi-res line. Next, the words describing each line are printed. There are also examples of Commodore graphics characters. This simple demonstration screen illustrates the purpose of the program: mixing standard characters with hi-res. To add the routine to your own program:

1. Remove lines 2580–2670. This part of the program draws the hi-res lines. Also, add a line: **2580 RETURN**.

2. Remove lines 2740–2910, the section from the demo routine where the words HORIZONTAL, VERTICAL, and so on are printed.

3. At the beginning of your program, insert a GOSUB2500. This subroutine POKEs some ML routines into memory and turns on the hi-res screen (the bitmap starts at 8192, hi-res color memory at 1024).

Using Text Print

If you want to turn on a single pixel, set the X and Y values and GOSUB 2920. The X (horizontal) value should be in the range 0–319 and Y should be between 0 and 199.

To put characters on the screen, you'll have to define some variables first:

TEXT$—the words which will appear on the hi-res screen.

TX—the X value (0–319) of where the first letter will appear. It should be a multiple of eight. An easy way to calculate TX is to imagine a normal screen with room for 40 columns numbered 0–39. Multiply the column number by eight and assign it to TX.

TY—the Y value (0–199), which must also be a multiple of eight. Take the row number (0–24) and multiply by eight.

TCOL—the color of the letters (foreground color 0–15 multiplied by 16, added to background color).

D—the direction of printing. Because of the way hi-res screen memory is organized, left to right is direction 8, downward printing is 320, and diagonal printing (down and to the left) is 328.

After the variables are defined, add GOSUB 2960 to the program and your words or characters appear on the screen. For example, if you wanted to label the left side of a graph with the numbers 1–9 in blue on white, you could put this line in your program:

```
50 TEXT$="987654321": TX=0: TY=13*8:
   TCOL=6*16+1: D=320: GOSUB2960
```

Machine Language For Speed

The main section of Text Print is written in BASIC, but there are also some machine language routines. Their functions could have been written in BASIC, but BASIC is fairly slow when there are a lot of POKEs to be done. They work as follows:

SYS 828 copies the first 128 shapes from character ROM down to 50176 and following. Interrupts must be turned off and the I/O bank switched out before this routine will work. This is taken care of in lines 2690–2730. This ML routine transfers the uppercase/graphics characters down to RAM. If you'd prefer the upper/lowercase letters, change these two lines:

```
3130 DATA234,72,138,72,152,72,160,0,185,0
     ,216,153,0,196,185,0,217,153,0,197,1
     85                              :rem 96
3140 DATA0,218,153,0,198,185,0,219,153,0,
     199,200,208,229,104,168,104,170,104,
     96                              :rem 96
```

SYS 869 clears the hi-res screen at 8192. In a matter of seconds, machine language does what would take BASIC half a minute.

SYS 923 fills color memory with the foreground and background colors you've chosen. Before calling this routine, POKE 251 with a number from 0 to 255 (foreground × 16 + background).

If you choose to append Text Print to Hi-Res Toolbox (elsewhere in this issue), you won't need the clear screen or color fill routines, although you can include them. You can also delete the BASIC routine (lines 2920–2950) that turns pixels on.

See program listing on page 75.

NOT JUST ANOTHER PRETTY (INTER)FACE

THE PRINTMASTER/+G With IntelliFeatures™

If you don't care what your printouts look like, you could use any old interface. If you want full performance, with advanced features you can use, then the PRINTMASTER/+G is for you! The Printmaster/+G has many features found no where else. Full graphics compatability with Epson, Star, Tally, Okidata, Gorila, NEC, and more. Graphics speed has been maximized by reducing or eliminating print head shuffling. It's fast! Completes Commodore printer test program in 4 minutes, 400% faster than most other interfaces. Emulation, transparent, listing, and decimal modes, plus two special wordprocessing modes. Cassette or externally powered.

WHAT ARE INTELLIFEATURES? These are the special advanced features of the Printmaster/+G. Set all margins and page length. Single page pause. Double density and reverse graphics switch settings. Secondary address lock. Enhanced graphics characters. The Printmaster ROM contains some special Commodore machine language routines which you can access with a LOAD command, just like a disk drive. LOAD"$",4,1 displays the disk directory without destroying BASIC memory. LOAD"STATUS",4,1 displays complete Printmaster settings and status. And more! Add $2.50 for shipping. Suggested retail $119.95

LOOK! 16K BUFFER EXPANSION - Plugs safely inside Printmaster/+G case. Accepts 16K in 40 seconds. Includes a second ROM which adds many more fantastic Intellifeatures. LOAD"RENUM",4,1 renumbers a Basic program. LOAD"OLD",4,1 recovers a NEW'd Basic program. LOAD"INSERT",4,1 merges a Basic program. Design and use Special character sets. LOAD"EDIT",4,1 to design special characters. Program any character to be up to 90 CHR$s. Many more features than we can list here. $89.95

LOOK! PRINTMASTER/S for RS232 printers - All of the features of the Printmaster/+G for an RS232 printer. Do graphics characters and dot graphics on your serial Epson or other supported printer. 300, 600, 1200, 2400 baud, word and parity. DTR or Xon-Xoff handshake. Plus/Minus 12 volts. Specify male or female DB25 connector. Add $2.50 for shipping. $139.95

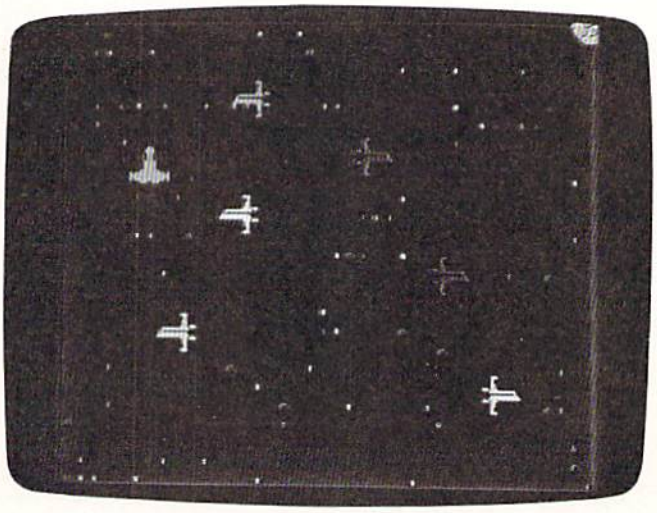
Space Dock

Aaron Bobick

Do you have the steady hand and quick eye it takes to land at a busy spaceport? Watch out for the other ships, they won't slow down or get out of your way. For the unexpanded VIC and 64. Joystick required.



Position and timing are essential. Here, the ship waits for the spaceport (partly visible in the upper right) to wrap around to the left (64 version).

You've taken your Class 3 OC-88DL mining ship to the asteroid belts and back. The cargo bays are brimming with valuable ore, as well as a few strange crystals you discovered. Six months in space is a long time; all you want is to dock the ship, collect your pay, and find a room with a hot bath.

But the traffic is heavy today. On arrival at the Lincoln International Spaceport, you were asked to go into a holding pattern. Finally, after three hours of flying in circles, you've been cleared for landing. You accelerate toward the landing bay and suddenly realize that every ship in the sector must be here, and they're all blocking your path. You hear an angry voice on the radio, "Hey, noodlebrain, where'd you learn to fly? Get out of my way." So you turn off the radio.

Limited Fuel

In "Space Dock," you have only one chance to reach the landing bay, because the fuel is nearly gone. And since the ship is completely full of ore, it can't change course very quickly. Use the joystick to move forward, left, and right. And avoid the other spaceships that are waiting to land. If you miss the landing bay, your ship is lost. You must touch down in the middle of the spaceport; if you miss slightly, it counts as a crash.

In the VIC version, you start with three ships. You get an extra (bonus) ship each time you dock successfully.

The 64 version is slightly different. You have five chances to dock, but are not given any bonus for success. At the beginning of the game, move the joystick up or down to choose level 1, 2, or 3. (Level 1 is the easiest.) Then press the fire button to begin. Push forward to accelerate, pull back to decelerate. You cannot stop completely, but you can adjust the speed somewhat.

Typing Instructions

The VIC version is written in BASIC. Remove or disable any extra memory, type in the program, and save it to tape or disk.

The 64 version is a little longer than 1K of machine language, and you'll need the MLX machine language editor, published regularly in the GAZETTE, to enter it. Load MLX, and answer the prompts as follows:

Starting Address: **49152**
Ending Address: **50597**

Enter the program and save it to tape or disk. When you load it back, you must use a secondary address of one: **LOAD"SPACEDOCK",8,1** (disk) or **LOAD"SPACEDOCK",1,1** (tape). To start, SYS49152.

See program listings on page 69.

Crunch

James A. Ledger

There are a number of advantages to crunching your programs: execution speed, efficiency, and more memory, to name the most obvious. This utility is one that every programmer should have in his toolbox. For the 64 and VIC-20.

One of the first skills a beginning programmer learns is how to "crunch" a BASIC program, reducing it to the smallest size possible by removing all spaces, shortening variable names, combining lines, and so on. It's usually quite tedious and time-consuming, and becomes even more so as the programmer writes longer programs. A lot of people have developed the bad habit of crunching their program as they type it in, with the result being hard to read and difficult to debug.

Why Crunch?

Why bother to crunch in the first place? For one thing, it allows your program to run faster and more efficiently. However, in some cases, especially on the VIC-20 with little or no memory expansion, it's the only way a program will run. But even the 64, with its relatively large RAM memory, occasionally runs into this problem. This can occur, for instance, in a lengthy program which uses large arrays. Every byte saved by reducing the program length can be used for string and variable storage.

With "Crunch" you can let your computer do the tedious work for you. After all, that's what computers are best at. In fact, this program will not only crunch your program in a matter of seconds, but the result will be much more compact than would be possible by hand. Originally written for the 64 and requiring a little over 1.5K of memory, I've added a version for the VIC-20 which retains the power of the 64 version while using only 880 bytes.

Eight Ways To Crunch

Combining Of Lines. One of the most remarkable things that Crunch can do is combine as many statements onto one line as possible. And you're not limited to 80 or 88 characters as you would be using the keyboard. In fact, it will use up to 255 bytes per line, or any lower limit you select (BASIC doesn't like lines longer than 255 bytes). That's bytes, not characters, and it can result in a line even longer than 255 characters. This is because BASIC keywords are stored as one byte tokens but are printed out using full length words.

Not every line can be combined with another one. BASIC keywords such as GOTO, GOSUB, IF-THEN, RUN, and LIST may be followed by a line number. The line they refer to is called a *referenced* or *target* line. Such a line cannot have its line number removed by combining it with the previous line.

Another special case is the IF-THEN statement. Any statement that follows an IF-THEN on the same line is executed only when the condition is true. Therefore, no additional lines can be added to the end without changing the logic of the program.

Spaces. All spaces within a program are removed except those within a string inside quotes and certain spaces within DATA statements as described below.

DATA Statements. If you group all of your DATA statements together, Crunch will combine them in a special way. Instead of just adding a colon and concatenating, a comma is added and the DATA token is dropped. For example:

```
10 DATA ABC,DEF
20 DATA GHI,JKL
```

would become:

```
10 DATAABC,DEF,GHI,JKL
```

This will continue up to the maximum number of bytes selected per line.

Spaces are also treated differently within a DATA statement. This is because BASIC allows you to define strings within a DATA statement without using quote marks. For example, the statement:

```
10 DATA JOHN DOE , 123 OAK LANE
```

would become:

```
10 DATAJOHN DOE ,123 OAK LANE
```

Notice that only leading spaces are deleted, while those within and trailing the data string are preserved. This is exactly how your computer would treat them. And since Crunch cannot tell whether a number within a DATA statement is meant to be used as a number or a string, all items are treated as strings. If you enclose your string data items within quote marks, as is sometimes necessary when using punctuation, then spaces trailing after the quote mark are also removed.

REMarks. Remarks are nearly always completely removed. However, if the remark is on a line by itself and is referenced by another statement (a bad practice, by the way), then the line following the remark is checked to see if it's referenced. If it's not, then its line number is changed to that of the referenced remark and the remark is completely dropped. If the next line is referenced, then only the text of the remark is removed. The REM token and its line number are preserved.

Variable Names. With Crunch, there's no reason why you can't use descriptive variable names such as AMOUNT and NAME$. Crunch will truncate all of them to the first two characters, since that's all your computer recognizes anyway. Just remember to keep the first two characters unique for each variable.

FOR-NEXT Statements. Whenever you terminate a loop with a NEXT command, it's not necessary that it be followed with a variable name such as NEXT J. Therefore, Crunch will remove all variables following NEXT. If you've used nested loops and terminate them with something like NEXT J1,J2, Crunch will transform it into NEXT:NEXT. This may look longer, but remember that BASIC keywords are stored as one byte tokens, so for the example given, three bytes are actually saved. If you've nested your loops properly, the computer will remember which loop to perform, and your program will run the same, actually, a little faster since it does not have to verify that the variable matches the one it was expecting.

End Quotes. Whenever the last thing on a BASIC line is a literal string within quotes, it's not necessary to include the final closing quote mark. This is because the carriage return at the end of the line terminates the quote mode. So whenever this occurs on the newly crunched line, the final quote mark is dropped.

On the other hand, if the programmer has already dropped the end quote, Crunch will tack it back on before concatenating the next line.

LET tokens. Few programmers use the LET command. (A=B+1 is the same as LET A=B+1). However, LET often adds a little clarity, especially for the beginning programmer. Crunch removes all LETs because they're not necessary.

Typing It In

The 64 version of Crunch is written entirely in machine language, so you'll need to use MLX, the machine language entry program published frequently in the GAZETTE. Here's the information you need to use Crunch with MLX:

Starting address = 49152
Ending address = 50795

After you've finished typing, save the program to tape or disk.

The VIC version of Crunch is also in machine language, but in order to allow it to be used with any size VIC memory, a compact BASIC loader is used. You should use the "Automatic Proofreader" (also published regularly in the GAZETTE) to type it in. The VIC version barely fits in an unexpanded VIC. The machine language portion, represented by the letters and numbers in the DATA statements, is not relocatable, but the loader program changes it as necessary in order to load it into the highest available memory. Be sure to save it before using it because the loader erases itself after hiding the machine language in top of memory.

How To Use Crunch

The 64 and VIC-20 versions have the same crunching power, but their directions for use are greatly different. Owners of both computers should read the directions for the 64, and then the differences for the VIC will be explained.

To load the 64 version you must use a secondary address of 1. Type **LOAD"filename",1,1** for tape or **LOAD"filename",8,1** for disk, then type **NEW** to reset various pointers. Crunch-64 resides in a portion of RAM not utilized by BASIC. It's also compatible with Commodore's DOS wedge program included on the Test/Demo disk. (Actually, the two programs are not compatible, but Crunch will disable it before starting and restore it when it's through.)

Next, load in the BASIC program you wish to crunch and type SYS 49152. The screen will

clear and change colors, and you'll be asked to select the maximum number of bytes desired per line: 255, 80, or original line length. Ordinarily, you should choose 255 since this will give you the maximum reduction in program size. The resulting program can be listed, saved, loaded, and relocated just like any other program. However, it is difficult to edit, since any line longer than 80 characters will have to be broken up and rewritten as several lines before the screen editor will accept them. This is not really a problem, however. You should save your uncrunched program for editing purposes since it contains all of the explanatory remarks, sensible variable names, and short, easy to read lines.

If you select 80 bytes per line, the resulting program will be a little easier to edit but at the cost of more memory. Most lines will then be 80 characters or less, and the few that do spill over 80 characters can be broken up into two lines.

If for some reason you do not want any line concatenation, select original line length. If a program has been crunched with a short line length selected, it can always be recrunched using a longer line length. However, the reverse is not true. Crunch will not break up a line to form a smaller line.

Crunch takes only seconds to completely rewrite your program. If there were no errors, you'll then see a summary showing the old program length, new program length, and number of bytes saved. The new program should now be saved using a new name. Or, you might want to keep the old name for the crunched program, since that's the one you'll use the most, and add an extension to the name of the uncrunched program such as ".S" for "source".

Before crunching, your program is first checked for nonexistent line numbers. For example, if your program contains a line that reads "100 GOTO 500", and there is no line 500, then you'll get this message:

```
100 LINE #500 DOES NOT EXIST
```

and your program will not be crunched.

To use the VIC-20 version of Crunch, first turn your computer off, then on, to completely clear memory. Do not use any type of wedge program while using VIC Crunch. Next, load and run Crunch just as you would any BASIC program, without the ",1" extension. The actual machine language program will be loaded to the top of memory, and certain pointers changed in order to protect it from BASIC. The loader program will then erase itself after printing the address to SYS in order to use Crunch. Write this address down. You now have 880 fewer bytes of memory, and on the unexpanded VIC this means that the program you want to crunch must be 2704 bytes or less in order for it to reside in memory at the same time.

A maximum line length of 255 bytes is automatically selected by the loader program in line 22 by POKEing location 250 with 255. If you wish to change it, POKE 250 with any number from 0–255 after running the program but before typing SYS, or permanently change line number 22 in the loader program.

Next, load the program you wish to crunch and SYS to the address previously given by the loader program. After a few moments you'll see the READY prompt, which means your program was successfully crunched. If your program contained references to nonexistent lines, you'll see an error message such as:

```
100 <500>
```

This means the error was in line number 100 and the nonexistent line was number 500.

Once you've saved your crunched program, turn your computer off and on to restore your full amount of memory before testing your new program.

Crunching The Cruncher

How was a 1.5K machine language program (the 64 version) reduced to 880 bytes while retaining all of the crunching power? The summary was deleted and the error message was shortened. Gone, too, is the convenient menu for selecting maximum line length. And neither the 64 version nor the VIC version uses a buffer to rewrite each line. Instead, the new program is written directly over the old (which is a little tricky). However, the greatest reduction was made by using numerous machine language routines already existing within the BASIC ROM interpreter. This was not done on the 64 for two reasons. First, it wasn't necessary, since the 64 version fits with room to spare inside a block of RAM memory unused by BASIC. Second, the 64's ROM has been subjected to various revisions in the past and could be revised again in the future. Therefore, any direct subroutine calls to the ROM operating system might not work on all or future machines.

If you'd rather not type in the program, you can order COMPUTE!'s GAZETTE DISK, offered elsewhere in this issue, or send a blank tape or formatted disk (VIC version, tape only) with a self-addressed, stamped mailer and $3 to:

James A. Ledger
7821 Country Dr.
Mobile, AL 36609

With Crunch in your programming toolbox, you can write programs that are easy to read and debug without sacrificing memory and speed.

See program listings on page 72.

ZOUNDS! Part 2

Lawrence Cotton

In this second of a three-part series, the author presents six more short and impressive sound demos for the Commodore 64.

Last month, we introduced this series with six short sound demos. This month, we'll look at (and listen to) six more. If you have last month's issue, take a minute to refresh your memory by looking back over the article, which discusses what "Zounds!" is and how you can use these demos as routines in your own programs.

The Zounds demos this month are short—only 3 to 12 lines—and can be made even shorter by deleting the REM statements in the program listings. As we mentioned last month, you can modify the sounds by changing various values in the programs. But, some of the programs are so delicately balanced that even a small change can produce some very unpleasant results. So be sure to save a copy of each program to disk or tape before running. And if you modify any of the sounds and find them to your liking, be sure to save them before experimenting further.

Sounding Off

All the programs in this series accomplish two things in the first two lines: clear the sound chip and set the volume to maximum in line 10; and set up the envelope (how fast a sound starts and ends) in line 20. Also, certain variables are consistent in all of the programs: The "Z" loop always represents the number of times a sound is cycled, and F1 and F2 are the two values POKEd into frequency registers for voices one and three, respectively.

"The Last Xither" contains only two nested loops—for frequency incrementing (Y) and for counting the number of cycles (Z). Try changing the initial value of F2 and its multiplier.

"Starwalker" is a two-part program based on waveform 23 (see Part 1 for more details on this). Notice the explanations in the REM statements.

"Not a Bell" uses three nested loops but is based on waveform 21 (sync omitted). Normally 21 is used for bell sounds which depend on an abrupt attack and a gradual release. But an attack/decay value of 8 and a sustain/release value of 255, combined with frequency sweeping (multiplying) yield sounds like anything but a bell.

For a super-crunched sound, try "Hyperwarp." We'll leave this one without comment and see if can you predict how it will sound before running it.

"Decelerator" is unique. It uses a combination of the square (64) plus triangle (16) waveforms, along with ring modulation (4) and gating (1) to yield a waveform value of 85. As mentioned in the REM in line 30, this is also the only program to use the least significant byte of the two frequency registers for voice one (54272).

My favorite sound is "Three Reasons to Own a Computer," which looks (as a listing) very much like the others but sounds entirely different. To see how delicately balanced this sound is, try changing any value just a little.

Experiment with these sounds and see what surprises your 64 has in store. Next month, we'll conclude our series with six more programs.

See program listings on page 76.

Creating Hi-Res Graphics On The 64

Todd Heimarck, Assistant Editor

With one POKE, you can make your 64 display a high-resolution graphics screen containing 64,000 points of light. It takes only a few more POKEs to set up the screen for your own hi-res pictures. Here's a step-by-step explanation of the mysteries of bit-mapped graphics on the 64.

If you've ever tackled high-resolution (hi-res) graphics on the 64, you probably remember first reading about a lot of PEEKs, POKEs, ANDs, ORs, bitmaps, bit masking, and 16K video banks. There are a few rules to learn—the "grammar" of hi-res—but we'll put them off for now. First let's experiment a bit, and create a hi-res screen with a single POKE:

```
POKE53265,PEEK(53265)OR32
```

Clear the screen (hold down SHIFT and press CLR/HOME). You'll notice that the colors are now red and black, but the screen didn't clear as you might have expected. You'll also see some points at the top of the screen blinking on and off. (If you're curious, that's the first 8K of memory you're seeing, including zero page.) Each one of the dots on the screen is a *picture element*, or *pixel* for short. The top part of the screen is a garbled mess, but the bottom seems to contain both character sets.

Now press some keys on the keyboard. The pixels under the cursor change color, as does the background color of each eight by eight block of pixels.

Apart from changing some colors, we don't seem to have any control over what appears on the screen. Set the screen back to normal by holding down RUN/STOP and tapping RESTORE.

Foreground Colors

A 64 can display 16 different colors, numbered 0 to 15:

0 Black	CHR$(144)	8 Orange	CHR$(129)
1 White	CHR$(5)	9 Brown	CHR$(149)
2 Red	CHR$(28)	10 Light Red	CHR$(150)
3 Cyan	CHR$(159)	11 Gray 1 (Dark)	CHR$(151)
4 Purple	CHR$(156)	12 Gray 2 (Medium)	CHR$(152)
5 Green	CHR$(30)	13 Light Green	CHR$(153)
6 Blue	CHR$(31)	14 Light Blue	CHR$(154)
7 Yellow	CHR$(158)	15 Gray 3 (Light)	CHR$(155)

There are several ways to change the foreground color. You can hold down CTRL (for colors 0–7) or the Commodore key (for colors 8–15) and press a number key from 1 to 8. Or you can PRINT a color change using the CHR$ values above—PRINT CHR$(129), for example, changes the cursor color to orange. You can also POKE to 646, the location in memory which keeps track of the current character color.

It's also possible to change colors by POKEing directly to color memory. This doesn't affect the current cursor color; it changes a character that's already on the screen. To see all 256 characters in white, run this program (don't type NEW after running it, we'll be using part of this program later):

```
15 PRINTCHR$(147);
20 FORJ=0TO255:POKE1024+J,J:POKE55296+J,1
   :NEXT
25 GOTO25
```

Line 15 clears the screen. Next, the screen codes 0–255 are POKEd into screen memory, and the number 1 (the color code for white) goes into 256 consecutive bytes of color memory. Screen memory runs from 1024 to 2023, with corresponding color memory at 55296 to 56295.

Five Screen Colors

Changing background colors requires a POKE or two. Five registers hold the current screen colors:

```
53280  Border Color
53281  Background Color 0
53282  Background Color 1
53283  Background Color 2
53284  Background Color 3
```

You may be familiar with statements like POKE53281,5, which changes the background color to green (try other numbers between 0 and 15, to see different background colors). The other three background colors can be used in two ways, multicolor mode and extended background color mode.

Extended Background Color Mode

Add the following line to the previous program and then type RUN.

```
12 POKE53281,15:POKE53282,6:POKE53283,1:P
   OKE53284,7:POKE53265,PEEK(53265)OR64
```

The four background registers are POKEd with 15, 6, 1, and 7—light gray, blue, white, and yellow. And 53265, the same register that controlled hi-res mode above, is ORed with 64 (more on OR below).

Examine the characters on the screen. Instead of 256 unique characters, there are now only 64. But they have different background colors. This is extended background color mode, where each character can have one of sixteen foreground colors and one of four background colors. You should see some characters that are solid white, because background color 2 and the character color are both the same. Change the color POKE at the end of line 20 to get new foreground colors. Or you could change the POKE to 53283 in line 12.

To get back to normal, enter **POKE53265, PEEK(53265)AND(255−64)**. Or, more easily, press RUN/STOP–RESTORE.

Multicolored Characters

Extended background color mode offers 16 foreground choices and four background choices, but each character still has only two colors. Multicolor mode allows you to paint characters with up to four colors. Press RUN/STOP–RESTORE, change the cursor color to black (CTRL-1) and list the program in memory. Now enter this in direct mode (without a line number):

```
POKE53270,PEEK(53270)OR16
```

Nothing happened, right? Now change the cursor color to one of the eight colors between orange and light gray (colors 8–15); for example, hold down the Commodore key and press 8. List the program again. Try POKEing different numbers into the registers from 53281 to 53283 to get different effects (53284 is not used in multicolor mode).

To see the full character set, add this replacement line to the program in memory (the [<8>] means type 8 with the Commodore key held down):

```
12 POKE53281,12:POKE53282,6:POKE53283,1:P
   RINT"[8]":POKE53270,PEEK(53270)OR16
```

If it doesn't work the first time, make sure line 20 is POKEing color memory (55296 and following) with a number higher than seven.

Screen Memory Becomes Color Memory

We'll do one more experiment before delving into the PEEKs, POKEs, ANDs, and ORs for hi-res. Delete line 12 from the program and add this line:

```
10 POKE53272,24:POKE53265,59
```

This is a stable area of memory. There are no blinking pixels at the top and no character sets at the bottom. You're looking at the 8000 memory locations 8192–16191, which have been translated from bits in memory to pixels.

The memory in this area is called a *bitmap* because each of the 64,000 bits here corresponds ("maps") to one of the pixels on the screen.

The POKEs to 1024 and on, which is usually screen memory, are doing something strange. Instead of putting 256 characters on the screen, the POKEs are displaying every combination of color.

Press STOP, cursor down to a blank (red and black) line and enter this:

```
FORJ=8192TO9191:POKEJ,7:NEXT
```

You'll have to type this blind—you won't see the characters, you'll see different color changes. If you make a mistake, the SYNTAX ERROR message will be printed underneath (in colors rather than characters). You could add this to your program as a line 24 if you prefer (press RUN/STOP–RESTORE and you'll be able to enter a new line). This series of 1000 POKEs changes the pattern of the pixels on the top three lines of eight pixels, plus part of the fourth line.

At this point, we have some control over the hi-res screen. The bitmap runs from 8192 to 16191, and the color map is located at 1024–2023. Now we'll learn more about turning individual pixels on and off.

Masking Bits

Each memory location in RAM contains eight bits that are like tiny switches you can turn on and off. The bits are numbered 0–7, *starting from the right*. Each bit has a specific value:

Bit #	7	6	5	4	3	2	1	0
Value	128	64	32	16	8	4	2	1

PEEKing a memory location yields a number from 0 to 255, depending on which bits are on and off (add up the values of the on bits to get the PEEK number).

You can turn individual bits on with the OR function. For example, 53265 usually holds a 27 (00011011). And we turned on hi-res mode by PEEKing 53265, ORing it with 32, and POKEing the result back into 53265:

```
        00011011   (27)
OR      00100000   (32)
        00111011   (59)
```

Note that if both bits are off (zeros), the result is a 0. But if either one *or* both are on, the result is 1.

The AND function allows you to turn bits off:

```
        00111011   (59)
AND     11011111   (223)
        00011011   (27)
```

The only time a 1 appears in the result is when both the first *and* the second bit are turned on. With specific ANDs and ORs, you can switch between hi-res, extended background, and multicolor modes.

Masking bits with AND and OR is also necessary for turning the hi-res screen pixels on and off.

Character Shapes

To put a red letter A in the top left corner of the screen, you would **POKE1024,1:POKE55296,2**.

A 64 has to translate the numbers in screen and color memory into the shape of a red A. It reads through character memory and finds eight numbers that represent the A shape, listed below in decimal and binary:

Decimal	Binary	Pixels
24	00011000	**
60	00111100	****
102	01100110	** **
126	01111110	******
102	01100110	** **
102	01100110	** **
102	01100110	** **
0	00000000	

For a regular character, the 1s are the foreground color, which is taken from color memory (55296–56295). The 0s are the color from background register 0 (memory location 53281). The top row of eight pixels for a red letter A on a white screen would be white, white, white, red, red, white, white, white.

A Screen With 1000 Custom Characters

Exactly 1000 regular characters can be displayed on the screen of the 64. As we saw above, each character shape is defined by eight bytes, each containing eight bits. So there must be 64,000 pixels on the entire screen (not counting the border). The hi-res screen contains 320 pixels across, 200 pixels down (320 × 200 = 64000).

Because each byte is composed of 8 bits, we need 8000 bytes of memory to bitmap the screen (8000 × 8 = 64,000). You might expect them to be numbered consecutively, but that's not how it works. In fact, the hi-res screen operates as if it were made of 1000 custom characters, each one eight bytes high and eight bits wide (remember, these are *bytes*, each of which contains eight bits):

```
  0    8   16   24  ...  312
  1    9   17   25  ...  313
  2   10   18   26  ...  314
  3   11   19   27  ...  315
  4   12   20   28  ...  316
  5   13   21   29  ...  317
  6   14   22   30  ...  318
  7   15   23   31  ...  319
320  328  336  344  ...  632
321  329  337  345  ...  633
```

If you were to take the eight numbers that define an "A" (24, 60, 102, 126, 102, 102, 102, and 0) and POKE them into the first eight bytes of the hi-res screen, the letter A would appear.

Finding The Pixel

You'd need a lot of graph paper and a calculator to figure out the coordinates for a large picture. Fortunately, there's a shortcut to figuring out which bits in memory correspond to certain pixels.

Imagine a grid numbered 0 to 319 across the top and 0 to 199 (from top to bottom) down the side. The top left corner would be location 0,0 and the bottom right would be 319,199. The first number is the X-value, the second the Y-value. To find the corresponding byte in memory, use these formulas:

```
HR = 8192: BY = HR + 40 * (YAND248) + (YAND7)
+ (XAND504)
```

(HR is the beginning of the hi-res screen; BY is the byte.)

Turn on the bit:

```
POKE BY, PEEK(BY) OR (2↑(NOTXAND7))
```

Turn off the bit:

```
POKE BY, PEEK(BY) AND (255−2↑(NOTXAND7))
```

The first line figures out which byte in memory to POKE, assuming the hi-res screen (HR) starts at 8192. The second figures out which bit inside the byte needs to be turned on or off.

Adding Color

To give each of the 64,000 pixels its own separate color would require 32,000 bytes of color memory. Due to the limits of the VIC-II video chip, this is impossible. So colors are assigned to groups of eight bytes (64 bits) as if each were a character. This reduces color memory to 1000 bytes.

In the example above, hi-res color memory was located at 1024–2023 (for technical reasons, we can't use the regular color memory). Byte 1024 contained color information for 8192–8199, 1025 held the colors for 8200–8207, and so on. In each byte of hi-res color memory, bits 0–3 control background color, and the top four bits correspond to the foreground color.

If you want to change the color of a group of 64 pixels, use the formula above to find the variable BY. Then subtract the variable HR (8192, in this case) and divide by eight. Add that number to 1024 (the beginning of hi-res color memory) to find the memory location to POKE. Multiply the foreground color (0–15) by 16 and add the background color (0–15):

```
HR=8192:CB=(BY-HR)/8+1024
CL=FG*16+BG
POKECB,CL
```

HR is the beginning of the hi-res bitmap, CB is the color byte, CL is the color, from FG (foreground) and BG (background).

The Limits Of The Video Chip

When you're working in hi-res, all of the video information—the 8000 byte bitmap and 1000 bytes of color memory—has to come from one of the four 16K banks of memory. You control which bank is used by POKE56578,3 and then a POKE to 56576:

Bank	POKE	Memory Used
* 0	POKE56576,7	0-16383
1	POKE56576,6	16384-32767
* 2	POKE56576,5	32768-49151
3	POKE56576,4	49152-65535

The VIC-II chip, which manages all the video information, can only "see" 16K of memory at a time. So sprite shapes and character shapes must also be within the 16K bank currently switched in.

The banks marked with asterisks contain shadows of character ROM: 4096–8191 in bank 0, 36864–40959 in bank 2. *You should not put hi-res screens, hi-res color, or sprite shapes in these two areas; the video chip sees only character shapes at these memory locations.*

A hi-res screen always starts at an even 8K boundary—a number divisible by 8192. Within each of the four 16K video banks you have two choices, first half or second, for a total of eight. Two are unavailable (because of the character shadows), leaving 8192, 16384, 24576, 40960, 49152, and 57354. Although BASIC and Kernal ROM start at 40960, the VIC-II chip gets its information from the RAM underneath the ROM, so it's possible to set up a hi-res screen that takes no memory away from BASIC.

To set the hi-res bitmap to the first 8K of a 16K bank, **POKE53272,PEEK(53272)AND247**. To put the bitmap at the second half of a bank, **POKE53272,PEEK(53272)OR8**.

You should also tell the 64 where the hi-res color memory will be located. There are 16 1K sections of memory (1024 bytes) within each video bank. They're numbered 0–15 and, to avoid interference with the hi-res screen, should be in the section you're not using for the bitmap—that is, the other half of the 16K bank. To set color memory, **POKE 53272, (PEEK(53272) AND 15) OR (16*CM)** where CM is a number between 0 and 15.

Five POKEs To Set Up Hi-Res

Let's say you want to put a hi-res screen at 16384, the first half of video bank one. Hi-res color memory can't go into the first eight 1K areas (numbered 0–7) because they're used by the bitmap. So we'll use section number 8 (starting at 16384 + 8 × 1024, or 24576). You would follow these steps in your program:

1. **POKE56578,3:POKE56576,6** to set video memory to 16K bank number one.

2. **POKE53272,PEEK(53272)AND247** to put the hi-res screen at the first 8000 bytes in bank one.

3. **CM=8: POKE53272, (PEEK(53272) AND15) OR (16*CM)** to set hi-res color memory to section 8 (24576). To put color memory elsewhere, change CM to another number 0–15.

4. **POKE53265,PEEK(53265)OR32** to turn hi-res on.

To clear the screen, you'll have to POKE a 0 into each of the 8000 locations from 16384 to 24383. Then, use the formulas for locating a pixel, changing HR (the beginning of the bitmap) from 8192 to 16384, and changing the beginning of hi-res color memory (CM) from 1024 to 24576.

A Memory Conflict

In our first example of hi-res graphics, we put the screen at 8192, with color memory beginning at 1024. Since BASIC programs are stored at 2049, about 6K below the bitmap area, this poses a problem: If the BASIC program and its variables grow beyond 6K, either the hi-res screen or the program will be scrambled.

There are two solutions: to move the beginning of BASIC up, past the end of the hi-res screen with **POKE44,64: POKE64*256,0: NEW**; or to move the hi-res screen out of the way of BASIC into 16K bank number 3 with **POKE 56578,3:POKE56576,4**. Either way, you'll avoid the memory conflict.

Hi-Res Toolbox

John E. Banks

The speed of machine language is important when you're working with hi-res graphics. This program for the 64 adds several ML routines you can call from BASIC.

One of the 64's excellent features is its ability to display a high-resolution screen with 64,000 individual specks of light you can turn on and off. But there are a couple of drawbacks to the way hi-res graphics are handled. First, it takes a lot of memory—8,000 bytes—to bitmap the screen. This is seldom a problem, though, because the 64 has plenty of memory for most applications.

The more serious problem is the slow speed of BASIC. Clearing the screen takes nearly half a minute (by POKEing zeros into all 8,000 locations). Machine language (ML) is the solution.

Two Example Programs

"Hi-Res Toolbox" adds a few ML routines that speed up or simplify certain hi-res functions. It's written as a BASIC loader, so you can just type it in and save to tape or disk.

When you first run it, the screen clears and a message appears. Enter RUN 100 to see a sample sine wave. RUN 200 gives you a doodling program. You can draw in hi-res with a joystick (port 2). Hold down the fire button and the pixel cursor will blink on and off; you'll be able to move around the screen without leaving a trail. (For more about hi-res graphics, see "Creating Hi-Res Graphics on the 64" elsewhere in this issue.)

These two internal BASIC routines (sine wave and the joystick doodler) are example programs embedded in Program 1 and are intended to show how to use the Toolbox commands, so feel free to modify them. Try RUN 100 once, press a key to go back to the regular screen, then remove the SYS CLEAR from line 205. Modify line 130, where the sine wave is calculated. Change SIN to COS. Change the 60 to a 30, or the (X/10) to (X/8). You could also revise the main loop to clear the hi-res screen if f1 is pressed, or add new routines for plotting circles and squares.

The machine language portion, discussed later, is relocatable, so if you have a program or utility that begins at 49152, change the value of SA in lines 600 and 1010 to another safe section of memory.

The Sine Wave

Here's how the sine wave program (lines 100–160) works:

Line 100 calls subroutine 1000, which turns on the hi-res screen and sets up necessary variables. The variable FLAG must be POKEd to zero if you want pixels to be turned on.

In line 110, the bitmap is cleared and the color combination set to black on white. The main loop is found in lines 120 through 150. The values of X and Y are calculated and then plotted. Line 160 waits for a key to be pressed and then goes to subroutine 2000, which sets the screen back to normal.

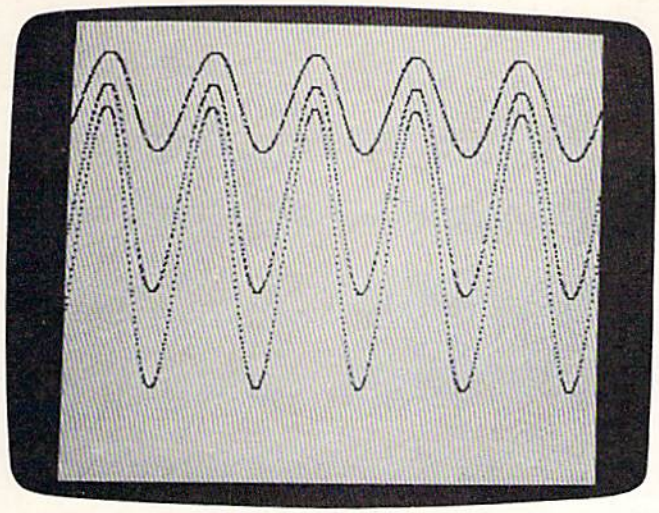
The Joystick Routine

Here's how the second routine, the joystick doodler, works. First, line 200 calls subroutine 1000, which turns on the hi-res screen, then line 205 clears it and sets the color to black pixels on a white background. Two arrays which assign joystick moves to the equivalent X/Y coordinates are created in lines 210–215.

Line 220 is the start of the main loop. First, the joystick is PEEKed to see if a new value should be plotted. New values of X and Y are assigned in lines 230–240. If the fire button is pressed, line 245 causes the cursor pixel to flash (without leaving a trail). The point is plotted in 250 and the program loops back to 220, to check the joystick again.

Four New Commands

The machine language routines (lines 600–2020) provide four new commands—CLEAR, COLOR, PLOT, and FLAG—which you can insert in your own programs. Lines 10–250 are used by the two BASIC routines discussed above. You needn't include them if you plan to use the ML hi-res routines in your own programs. At the beginning of your program, include a GOSUB600 (you only have to do this once in your program).



A mathematical pattern—three sine waves—created with Toolbox commands.

A joystick routine converts Hi-Res Toolbox to an artist's drawing pad.

Here's how to use the new commands:

SYS CLEAR rapidly clears the bitmap area that controls the hi-res screen.

SYS COLR,C (where **C** is a number 0–255) fills color memory with your choice of foreground and background colors. Calculate C with the formula C=FG*16+BG using color codes 0–15 for FG (foreground) and BG (background). And be sure to put a comma between COLR and C.

SYS PLOT,X,Y turns the pixel at X/Y on or off, depending on the value in FLAG. Always keep X within the range 0–319 and Y within 0–199. You can insert numbers, variables, or even formulas for X and Y. The top left corner is location 0,0; the bottom right is 319,199. The X-axis runs across the top of the screen left to right. The Y-axis is vertical from top to bottom.

POKE FLAG,0 causes SYS PLOT to turn pixels on. **POKE FLAG,1** turns pixels off when a SYS PLOT occurs.

In addition to the ML routines, there are two BASIC subroutines which control the hi-res screen. GOSUB 1000 each time you want to turn on the hi-res screen. Lines 1010–1020 put the bitmap at 8192, and the color memory at 1024. The other subroutine starts at 2000. It turns hi-res off, and clears the normal screen.

Avoiding Memory Problems

In certain cases, Hi-Res Toolbox could interfere with BASIC programs. The bitmap starts at 8192, with hi-res color memory at 1024. If your program (plus variables) becomes larger than about 6K, either variables will overwrite the hi-res screen, or the screen will destroy the end of your BASIC program.

If you anticipate such a conflict, move the beginning of BASIC up to 16384, with a POKE and a SYS:

```
POKE642,64:SYS58260
```

Be sure to enter this line before you load the program you're working on.

A Few Ideas

High-resolution graphics are not just for mathematicians studying sine waves or artists who like doodling with a joystick. A hi-res screen is like a piece of graph paper containing 64,000 squares. It's especially good for business applications like graphs and charts. If you invest in stocks, you could get a whole year's worth of information on one screen (52 weeks of 5 days each is 260, well within the horizontal resolution of 320 pixels). It's possible to save a section of memory as if it were a program, so you could use "MetaBASIC" (in the April 1985 issue) to BSAVE"CHART",8192,16192. You can then retrieve the screen from disk with LOAD"CHART",8,1.

Also, hi-res is often used in games to give the illusion of three dimensions. Sprite graphics are not affected by hi-res mode (but be sure not to put the sprite shapes in the memory used by the bitmap).

You could even create your own Turtle language (similar to Logo) for drawing pictures on the screen. You can then print them out using a hi-res screen dump program.

It's possible to put text on a hi-res screen (see "Mixing Text and Hi-Res Graphics," which is compatible with Hi-Res Toolbox, elsewhere in this issue). This provides even more flexibility when working in hi-res.

See program listing on page 76.

ReDisk

Michael Mueller

Making backups of machine language programs and sequential files is a breeze with this fast and efficient utility for the 64, VIC, Plus/4, and 16. It's also a handy tool for GAZETTE DISK subscribers.

Copying programs written in BASIC is easy. It's as simple as loading the program from one disk and saving it to another. This method is fine for BASIC programs but is useless for machine language programs and sequential files.

"ReDisk" allows you to copy any unmachine language program or sequential file. And, if you're copying to a new disk, the program provides a format option.

ReDisk is a very short program, using less than 2K of memory, and some machine language is used (in DATA statements) to increase speed. You don't need to know anything about machine language, however, to use the program.

Be extremely careful when typing in the program, taking special precaution with the DATA statements, which are the machine language portion of the program. Also, be sure to save a copy before typing RUN.

ReDisk is written for the 64, but with the following single line substitutions, it will run on other Commodore computers.

For the unexpanded VIC:

```
1 F1=7679:F2=3:F$="{20 SPACES}{UP}"
                                    :rem 154
```

For the VIC with 8K expansion:

```
1 F1=16383:F2=3:F$="{20 SPACES}{UP}"
                                    :rem 194
```

For the VIC with 16K expansion:

```
1 F1=24575:F2=3:F$="{20 SPACES}{UP}"
                                    :rem 196
```

For the Plus/4:

```
1 F1=32767:F2=3:F$="{39 SPACES}{UP}"
```

For the Commodore 16:

```
1 F1=16127:F2=3:F$="{39 SPACES}{UP}"
```

Getting Started

After you've determined which file (machine language program or sequential file) you wish to copy, write it down on a piece of paper and note whether it is a program (PRG) or sequential (SEQ) file. Load ReDisk and respond to the prompts, pressing RETURN after each entry. The first prompt asks if you wish to format the "Destination" disk (note that "Destination" disk is the disk to receive the file to be copied, and "Source" disk is the disk containing the program to be copied). An "N" (for "No") appears with the flashing prompt, so just press RETURN if you do not wish to format the disk. Press "Y" if you do.

When entering disk names, disk IDs (for the format option only), filenames, and file types, be sure to use a comma with no spaces before or after. The screen example serves as a reminder.

It's handy to have the Commodore DOS Wedge program (supplied with your disk drive) loaded into memory before loading ReDisk, since this allows you to look at a disk directory without disturbing the current program. This also makes memorizing or writing down filenames unnecessary.

See program listing on page 69.

How To Type In COMPUTE!'s GAZETTE Programs

Each month, COMPUTE!'s GAZETTE publishes programs for the VIC-20, Commodore 64, Plus 4, and 16. Each program is clearly marked by title and version. Be sure to type in the correct version for your machine. Also, carefully read the instructions in the corresponding article. This can save time and eliminate any questions which might arise after you begin typing.

We publish two programs, which appear periodically, designed to make your typing effort easier: The Automatic Proofreader, and MLX, designed for entering machine language programs.

When entering a BASIC program, be especially careful with DATA statements as they are extremely sensitive to errors. A mistyped number in a DATA statement can cause your machine to "lock up" (you'll have no control over the computer). If this happens, the only recourse is to turn your computer off then back on, erasing whatever was in memory. So be sure to *save a copy of your program before you run it.* If your computer crashes, you can always reload the program and look for the error.

Special Characters

Most of the programs listed in each issue contain special control characters. To facilitate typing in any programs from the GAZETTE, use the following listing conventions.

The most common type of control characters in our listings appear as words within braces: {DOWN} means to press the cursor down key; {5 spaces} means to press the space bar five times.

To indicate that a key should be *shifted* (hold down the SHIFT key while pressing another key), the character is underlined. For example, A means hold down the the SHIFT key and press A. You may see strange characters on your screen, but that's to be expected. If you find a number followed by an underlined key enclosed in braces (for example, {8 A}), type the key as many times as indicated (in our example; enter eight SHIFTed A's). To type {SHIFT-SPACE}, hold down the SHIFT key and press the space bar.

If a key is enclosed in special brackets, ⟦ ⟧, hold down the Commodore key (at the lower left corner of the keyboard) and press the indicated character.

Rarely, you'll see a single letter of the alphabet enclosed in braces. This can be entered on the Commodore 64 by pressing the CTRL key while typing the letter in braces. For example, {A} means to press CTRL-A.

The Quote Mode

Although you can move the cursor around the screen with the CRSR keys, often a programmer will want to move the cursor under program control. This is seen in examples such as {LEFT}, and {HOME} in the program listings. The only way the computer can tell the difference between direct and programmed cursor control is *the quote mode.*

Once you press the quote key, you're in quote mode. This mode can be confusing if you mistype a character and cursor left to change it. You'll see a reverse video character (a graphics symbol for cursor left). In this case, you can use the DELete key to back up and edit the line. Type another quote and you're out of quote mode. If things really get confusing, you can exit quote mode simply by pressing RETURN. Then just cursor up to the mistyped line and fix it.

When You Read:	Press:	See:

The Automatic Proofreader

"The Automatic Proofreader" will help you type in program listings from COMPUTE!'s Gazette without typing mistakes. It is a short error-checking program that hides itself in memory. When activated, it lets you know immediately after typing a line from a program listing if you have made a mistake. Please read these instructions carefully before typing any programs in COMPUTE!'s Gazette.

Preparing The Proofreader

1. Using the listing below, type in the Proofreader. The same program works on both the VIC-20 and Commodore 64. Be very careful when entering the DATA statements — don't type an l instead of a 1, an O instead of a 0, extra commas, etc.

2. SAVE the Proofreader on tape or disk at least twice *before running it for the first time.* This is very important because the Proofreader erases this part of itself when you first type RUN.

3. After the Proofreader is SAVEd, type RUN. It will check itself for typing errors in the DATA statements and warn you if there's a mistake. Correct any errors and SAVE the corrected version. Keep a copy in a safe place — you'll need it again and again, every time you enter a program from COMPUTE!'s Gazette.

4. When a correct version of the Proofreader is RUN, it activates itself. You are now ready to enter a program listing. If you press RUN/STOP-RESTORE, the Proofreader is disabled. To reactivate it, just type the command SYS 886 and press RETURN.

Using The Proofreader

All VIC and 64 listings in COMPUTE!'s Gazette now have a *checksum number* appended to the end of each line, for example ":rem 123". *Don't enter this statement when typing in a program.* It is just for your information. The rem makes the number harmless if someone does type it in. It will, however, use up memory if you enter it, and it will confuse the Proofreader, even if you entered the rest of the line correctly.

When you type in a line from a program listing and press RETURN, the Proofreader displays a number at the top of your screen. *This checksum number must match the checksum number in the printed listing.* If it doesn't, it means you typed the line differently than the way it is listed. Immediately recheck your typing. Remember, don't type the rem statement with the checksum number; it is published only so you can check it against the number which appears on your screen.

The Proofreader is not picky with spaces. It will not notice extra spaces or missing ones. This is for your convenience, since spacing is generally not important. But occasionally proper spacing *is* important, so be extra careful with spaces, since the Proofreader will catch practically everything else that can go wrong.

There's another thing to watch out for: if you enter the line by using abbreviations for commands, the checksum will not match up. But there is a way to make the Proofreader check it. After entering the line, LIST it. This eliminates the abbreviations. Then move the cursor up to the line and press RETURN. It should now match the checksum. You can check whole groups of lines this way.

Special Tape SAVE Instructions

When you're done typing a listing, you must disable the Proofreader before SAVEing the program on tape. Disable the Proofreader by pressing RUN/STOP-RESTORE (hold down the RUN/STOP key and sharply hit the RESTORE key). This procedure is not necessary for disk SAVEs, *but you must disable the Proofreader this way before a tape SAVE.*

SAVE to tape erases the Proofreader from memory, so you'll have to LOAD and RUN it again if you want to type another listing. SAVE to disk does not erase the Proofreader.

Since the Proofreader is a machine language program stored in the cassette buffer, it will be erased during a tape SAVE or LOAD. If you intend to type in a program in more than one sitting or wish to make a safety SAVE, follow this procedure:

1. LOAD and RUN the Proofreader.
2. Disable it by pressing RUN/STOP–RESTORE.
3. Type the following three lines in direct mode (without line numbers):

```
A$="PROOFREADER.T":B$="{10 SPACES}":FO
RX=1TO4:A$=A$+B$:NEXTX
FORX=886 TO 1018:A$=A$+CHR$(PEEK(X)):N
EXTX
OPEN1,1,1,A$:CLOSE1
```

After you type the last line, you will be asked to press RECORD and PLAY. We recommend you start at the beginning of a new tape.

You now have a new version of the Proofreader (PROOFREADER.T, as renamed in the above code). Turn your computer off and on, then LOAD the program you were working on. Put the cassette containing PROOFREADER.T into the tape unit and type:

OPEN1:CLOSE1

You can now get into the Proofreader by typing SYS 886. To test this, PRINT PEEK (886) should return the number 173. If it does not, repeat the steps above, making sure that A$ (PROOFREADER.T) contains 13 characters and that B$ contains 10 spaces.

The new version of Automatic Proofreader will load itself into the cassette buffer whenever you type OPEN1:CLOSE1 and PROOFREADER.T is the next program on your tape. It will not disturb the contents of BASIC memory.

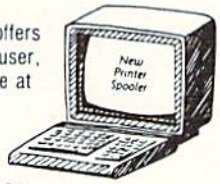
GENERICWARE

Finally, a company that offers you, the Commodore 64 user, excellent quality software at an economical price.



FOR THE COMMODORE 64

!!NEW!!

PRINTER SPOOLER
FOR MULTI-TASK OPERATIONS

The new Printer Spooler by **GENERICWARE** allows you to print files from disk while running other programs on your Commodore 64. No more waiting to use your computer. With the Printer Spooler you can load, save and verify programs while printing files.

The Printer Spooler includes: A print screen function, which lets you print a "picture" of the current video screen; single key re-entry to the Printer Spooler program, which eliminates the need to re-load the program from disk; and an automatic paging option, which includes page numbers.

SAVE $5.00 - LIMITED INTRODUCTORY OFFER

Now through July 31, you can purchase the new Printer Spooler for only $19.95. Send check or money order for $19.95 plus $2.00 shipping and handling (CA residents add 6% sales tax) to: **GENERICWARE**, P.O. Box 4277, Visalia, CA 93278. For VISA or Mastercard orders call (209) 732-7779 (add 3% for charge orders). Sorry, no C.O.D.'s.

PEEK A BYTE™ 64
DISK MECHANIC

New! VERSION 2.0

INVESTIGATE PROTECTED DISKS!

PEEK A BYTE 64 Now with the DISK MECHANIC is the most powerful disk editor and memory utility available for the Commodore 64 and 1541 disk drive.

- Read or write sectors hidden by DOS header errors
- Read or write up to track 40 - half tracks too!
- Fast format single or multiple tracks up to track 40
- Over 50 functions - includes all PEEK A BYTE features
- Complete manual for beginners and pros
- Disk copy program included at no extra charge!
- Continuing program update policy.

PEEK A BYTE is a Trademark of Quantum Software.
To order send check or money order, US funds. Foreign add $4 for shipping and handling. Florida residents add 5% (or 6%) sales tax. COD orders add $2 plus postage and COD charges. Phone COD orders call (305) 840-0249

ALL THIS FOR ONLY $35 U.S. Post Paid

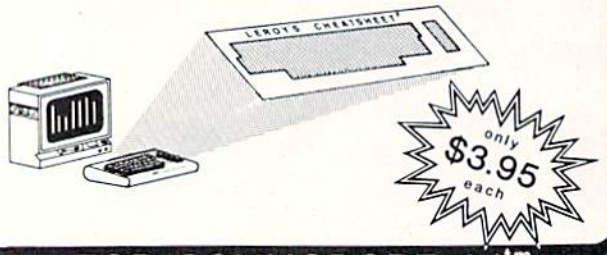
LEROY'S CHEATSHEET®

KEYBOARD OVERLAYS



FOR COMMODORE 64™

(VIC-20 also available)

LEROY'S CHEATSHEETS® are plastic laminated keyboard overlays designed for use with popular software and hardware for Commodore's VIC-20 & C-64 computers.

These cut-it-out yourself overlays are designed to fit over the keyboard surrounding the keys with commands and controls grouped together for easy references.

LEROY'S CHEATSHEETS®

make life easier for you

---

you could be the one to WIN $5000 by playing the exciting game of MAD SCIENTIST 64

MAD SCIENTIST 64 is a disk based educational game for the Commodore 64tm. Actually a game within a game-You advance by solving "game clues". Along the way, you receive "solution clues" based on U.S. history & current events. Very interactive like the Adventure & Infocom games.

To promote this game, we are offering five cash prizes to the best registered game players: a Grand Prize of *$5000* and four separate second place prizes of *$2500* each. Entrants will be divided into 5 equal groups by postal zip. The Grand Prize will go to the best overall score. The highest score in the other 4 groups receive the second place prizes.

All prizes will be awarded. You must return an answer sheet. Provisions for breaking ties. Extensive protection against cheating. 15 day money back guarantee.

Game shipments begin Jun 15, 1985. Answer sheets must be received by us no later than Nov 15, 1985. Winners will be announced on Dec 20, 1985.

Only U.S. entrants are eligible for the cash prizes, & in the U.S., the cash prize is void where prohibited by law.

To receive your MAD SCIENTIST 64 game disk, manual, blank scoresheet, and registration send *$24.95* plus $2.00 shipping & handling to:

SMADA ENTERPRIZES, INC.
P.O. BOX 1382
BELLEVUE, NE. 68005

DEALER INQUIRIES INVITED

PLEASE NOTE: When we ask you to call for a price it's because prices on those items are volatile, and we want to be sure we can give you the lowest prices we can.

To Order By Mail: Send personal check, money order, or certified check. Allow 2 weeks for personal checks to clear.

Shipping: Software and accessories - add $2.50 per order - COD orders - add $3.50 to regular shipping charge per box shipped - Printers - add $10.00 - Disk Drives and Monitors - add $8.00. Call for other shipping charges. Additional shipping required on APO, FPO, AK, HI, and foreign orders.

Terms: All prices reflect cash discount, add 3% for MasterCard or Visa. Manufacturer's warranties honored with copy of our invoice. ALL SALES ARE FINAL. Defective products replaced or repaired at our discretion. Pennsylvania residents add 6% sales tax. Prices and terms subject to change without notice.

ATTENTION

ALL COMMODORE 64, VIC 20, COMMODORE 16, AND PET OWNERS

A complete self-tutoring BASIC programming course is now available. This course starts with turning your computer on, to programming just about anything you want! This course is currently used in both High School and Adult Evening Education classes and has also formed the basis of teacher literacy programs. Written by a teacher, who after having taught the course several times, has put together one of the finest programming courses available today. This complete 14 lesson course of over 230 pages is now available for the COMMODORE 64, VIC 20, COMMODORE 16 and PET computers and takes you step by step through a discovery approach to programming and you can do it all in your leisure time! The lessons are filled with examples and easy to understand explanations as well as many programs for you to make up. At the end of each lesson is a test of the information presented. Furthermore, ALL answers are supplied to all the questions and programs, including the answers to the tests. Follow this course step by step, lesson by lesson, and turn yourself into a real programmer! You won't be disappointed!

We will send this COMPLETE course to you at once for just $19.95 plus $3.00 for shipping and handling (U.S. residents, please pay in U.S. funds). If you are not COMPLETELY satisfied, then simply return the course within 10 days of receipt for a FULL refund.

Fill in the coupon or send a facsimile.

CONVERSE WITH YOUR COMPUTER

AT LAST! A FULL IMPLEMENTATION of the original ELIZA program is now available to run on your Commodore 64!

Created at MIT in 1966, ELIZA has become the world's most celebrated artificial intelligence demonstration program. ELIZA is a non-directive psychotherapist who analyzes each statement as you type it in and then responds with her own comment or question—and her remarks are often amazingly appropriate!

Designed to run on a large mainframe, ELIZA has never before been available to personal computer users except in greatly stripped down versions lacking the sophistication which made the original program so fascinating.

Now, our new Commodore 64 version possessing the **FULL** power and range of expression of the original is being offered at the introductory price of only $25. And if you want to find out how she does it (or teach her to do more) we will include the complete **SOURCE PROGRAM** for only $20 additional.

Order your copy of ELIZA today and you'll never again wonder how to respond when you hear someone say, "Okay, let's see what this computer of yours can actually do!"

READ WHAT THE EXPERTS SAY ABOUT OUR VERSION OF ELIZA:

"Much more than a mere game...You'll be impressed with ELIZA...A convincing demonstration of Artificial Intelligence." —*PC MAGAZINE*

"Delightful entertainment...An ideal medium for showing off your system." —*MICROCOMPUTING MAGAZINE*

"ELIZA is an astounding piece of software...A fascinating program to use and study." —*BARON'S MICROCOMPUTER REPORTS*

"ELIZA is a great way to introduce your friends to computers...A very funny party game." —*PETER A. McWILLIAMS*

"ELIZA is an exceptional program, one that's fun to use, shows off your machine, and has great historical interest." —*POPULAR COMPUTING MAGAZINE*

"This version of ELIZA is the best we have seen. As a party game, it is unmatched." —*HOME APPLICATIONS FOR THE C-64*

ELIZA IS AVAILABLE IN THE FOLLOWING FORMATS:
(Please specify Disk or Cassette)

1. Protected Version $25
   (Protected Version can be run but not listed or modified)
2. Un-protected Commodore 64 BASIC Source Version $45
   (Source Version can be listed and modified as well as run)

Both versions include a six page user manual.

Please add $2.00 shipping and handling to all orders
(California residents please add 6½% sales tax)

Even Spock Would Find It Challenging

C-64 & C-128* OWNERS:

Now YOU too can get the "Software Edge"!

Stop playing "Hide-and-Seek" with your Disk software! Let your Commodore 64™ "memory" do all the work for you with **MASTERDISK©**. Easy Manual and Program Menu-Screens make everyone a "pro" in 1 day!

Here's a small "PEEK" at SOME of the FULLY-INTEGRATED POWER of PRODUCTIVITY at your fingertips...

- a SORTED Master Catalog of ALL your Disks (even those un-listable "protected" Directories: Names, ID's, File info, etc.)
- Search + List any File/Disk/ID in seconds, automatically, in any of SEVEN WAYS.
- Transfer ML-Programs or Files from Disk to Disk (CATEGORIZE your software)
- Stop disaster before it strikes: change duplicate ID's fast, without total re-copy.
- Restore accidentally-scratched files in a flash, with VERIFICATION that they're OK.
- Works with 1 or 2 Single Disk Drives (1541, MSD, etc.) with or without Printer (Commodore or ASCII).
- Handy-Reference Card for HEX/ASCII/BINARY-TO-DECIMAL VALUE TRANSLATION + FORMULAS, included FREE.
- All this + MUCH MORE, for just $34.95. (U.S.A.), $45.95 (Canada)

NEW!! - MASTERDUAL©, "Son of MASTERDISK©"...
same power, but with Dual Drive Speed!

- Same Catalog Features as MASTERDISK©
- Same Disk repair functions, too
- For all C-64 & C-128* systems with Dual Disk Drives (4040, MSD, etc.)
- Utilizes all Dual Drive functions for maximum speed and ease of use
- FREE Handy Reference Card for HEX/ASCII/Binary to Decimal Translation + Formulas
- Experience FULLY-INTEGRATED POWER for just $29.95 (U.S.A.), $39.95 (Canada)

***MASTERDISK© and MASTERDUAL©** are also compatible with the NEW C-128 (in C-64 Mode)!

We ship within 24 hours! Send Money Order or Check to:

Introducing . . .

THE 99¢ DISKETTE

Are you paying too much for diskettes? Try our first quality, prime, 5¼" diskettes (no rejects, no seconds) at these fantasic sale prices and save, save, SAVE! Disks are packaged in boxes of 50; each box contains 5 shrink-wrapped 10-packs that include diskettes in sleeves, labels, and write-protect tabs.

Each diskette is certified to be 100% error free and comes with a lifetime warranty (if you have a problem, we'll replace the diskette). All diskettes include hub reinforcement rings and write-protect notch.

All diskettes are double density and work in either single or double density drives.

SS, DD Diskettes, Box of 50
32391 **$49.50**–99¢ ea.!

DS, DD Diskettes, Box of 50
32403 **$64.50**–$1.29 ea.!

LOWEST PRICES!

We can offer you some of the lowest prices in the country on the most popular printers, monitors and interfaces. Our normal prices are already low, but to make sure you get the best deal you can, we will also meet most competitive prices in this publication when placed on an equal basis (Remember—we don't charge for use of your credit card, impose excessive shipping fees, or use any other hidden extras to boost the price you pay. Due to the rapid change in prices in the computer industry, we can only meet prices at the time you place your order; we cannot adjust prices on items ordered or shipped on an earlier date.) Another plus for charge card customers—your charge card is billed at time of shipment only for the items shipped—no early billing, no long wait for the merchandise you already paid for.

CAN YOU KEEP A SECRET? Well, Your Commodore Can.

All you need is the **Secret Software Package** from **ALSOFT.**

This amazing New Package includes 3 programs:

SECRET SEQUENTIAL: Scramble any disk sequential file (up to 330 blocks) from any program.

SECRET DIARY: Keep a diary of your daily affairs that only you can read.

SECRET ACCOUNTS: Tracks 40 accounts, secretly. Hardcopy Printouts on any properly interfaced printer.

Versions are available for the Commodore "C-64" or the "Plus 4" models (Specify). It is fully menu driven and easy to use, offering complete secrecy using password protection. Data is not simply "Covered-Up" by a password but is completely changed from beginning to end, ensuring that your file cannot be read by persons (including hackers) not knowing the correct password. Unique 240 character password capability provides for over 1.0 + E400 (1 followed by 400 zeros) different passwords combinations.

Available on Disk or Cassette (Please specify)
for ONLY $29.95

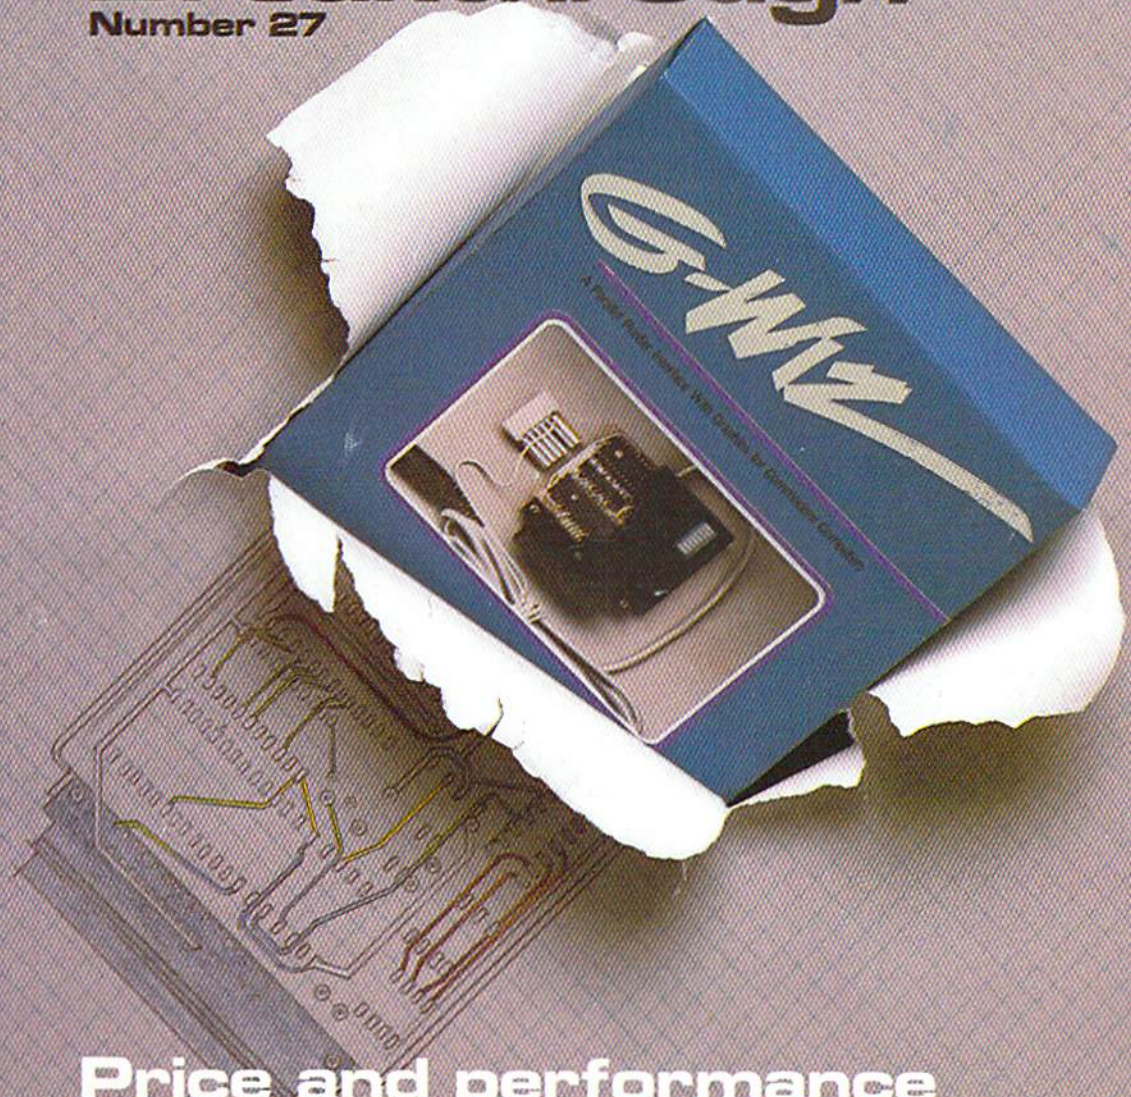
Breakthrough

Number 27



Price and performance
no other printer interface can touch!

Only CARDCO would dare improve on its own best seller (the +G has far out-sold any other printer interface, and has set the industry standard by which competitors are judged). The G-Wiz is even better — and costs 30% less.* Our 27th major innovation in Commodore accessories has all the +G's features, and more...

Built-In Buffer for More Speed
The G-Wiz buffer dumps high-resolution screens up to 18 times faster than competitive interfaces without buffers. No more waiting! A complex 50-minute printout now takes just 2.5 minutes with the G-Wiz.

Exclusive! Aspect Ratio Selection
Only the G-Wiz matches graphics characters to standard characters on Okidata, Epson, Star Micronics, Prowriter, Smith Corona, C-ITOH, Gorilla Banana, and many other dot matrix printers. Now you can perfectly align high resolution graphics characters within text blocks, or in columns.

CARDCO excellence triumphs again! The G-Wiz is the "best bang for the buck" on the printer interface market today — and it's backed by CARDCO'S exclusive lifetime warranty! G-Wiz: another distant target for the competition to shoot at.

CARDCO, Inc. 300 S. Topeka/Wichita, KS 67202

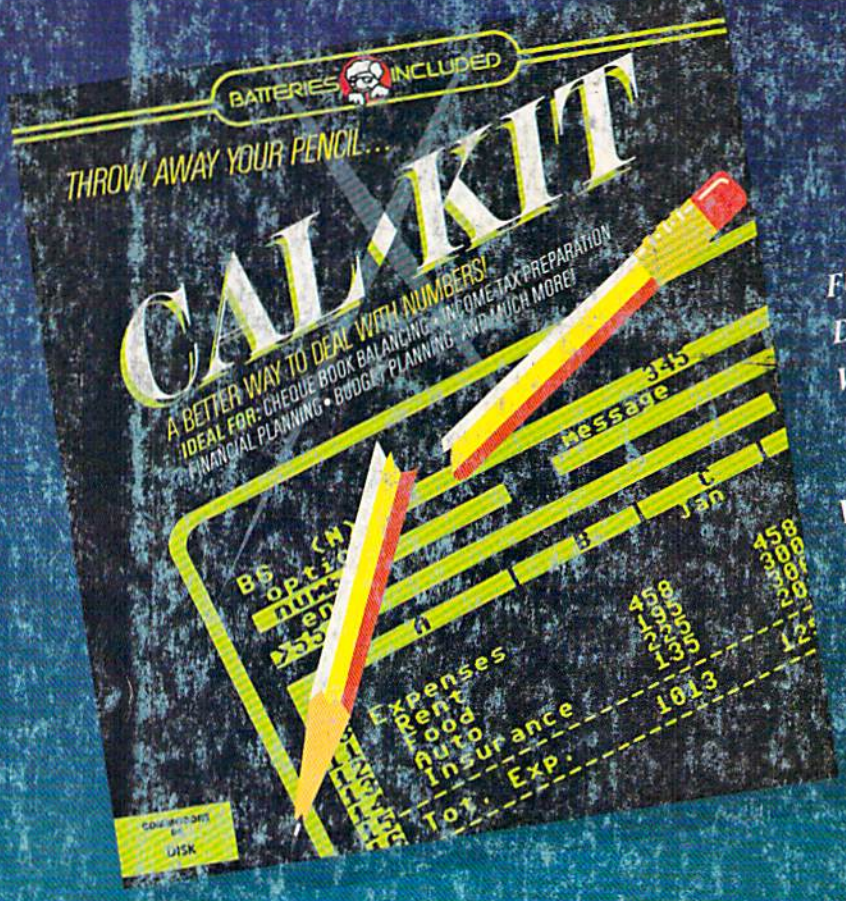
*Actual price may vary according to dealer and region.

The Wizards from the Land of Oz Have Done It Again!

For COMMODORE 64

MAKE NO MISTAKE...

CALKIT for your Commodore 64 is a powerful, real-world problem solver. Faster, easier and more accurate than pencil, paper and calculator – and a lot less frustrating.



FULL 80 COLUMN DISPLAY OPTION WITH THE B.I.-80 80 COLUMN DISPLAY CARD!™ From Batteries Included

CalKit helps you solve household and small business problems that involve rows and columns of numbers.

- balance your chequebook in seconds
- plan your home or business budget with ease
- simplify your income tax, and your investment portfolio
- calculate loan or mortgage payments, and then find out what happens to them in seconds, when interest rates change

That's the real advantage – with CalKit, you can change any number in your equation, and see how it affects the other numbers. All calculations are performed instantly! CalKit gives you the answers, in the time it takes to ask "What If...?" You can make projections and plan ahead with confidence!

The CalKit problem-solving package includes built-in templates for the most important home and business needs. Over 20 ready-to-use, real-life applications on one disk. The rows, columns and calculations are already defined. No need for time-consuming initial set-ups – all you do is enter your data. Other CalKit features, like on-screen menu and simple commands, make it even easier.

An easy and comprehensive manual with tutorials on each application are included. You'll be using CalKit like a pro, right out of the box. And once you've mastered the built-in templates, you'll be ready for your own unique spreadsheet programs.

Powerful solutions + ease of use + low low cost = CalKit. It all adds up to exceptional value, for a computer program that can help you every day.
